Interplay between Stem Cells, the Immune System, Leukemia, and Aging

By Nicole Lacerda

Abstract

This review explores the interplay between stem cells, the immune system, leukemia, and aging, focusing on their roles in hematopoiesis, leukemia progression, and therapeutic strategies. Hematopoietic stem cells (HSCs) are crucial for blood cell production, but their regenerative potential diminishes with age, increasing leukemia risk (Shevyrev et al., 2023). Leukemia stem cells (LSCs), originating from mutated HSCs, drive disease progression and resist conventional therapies (Clara et al., 2020). Stem cell therapies like hematopoietic stem cell transplantation (HSCT) and CAR-T cell therapy show promise but face challenges due to patient variability and stem cell heterogeneity (Putnam et al., 2023; Brown, 2022). Aging further complicates these relationships through immunosenescence and chronic inflammation, promoting leukemic cell survival (Chen et al., 2024). This review synthesizes current knowledge on these complex interactions, highlighting the need for personalized treatment strategies and improved therapeutic approaches for hematological diseases.

Keywords: aging, hematopoietic stem cells (HSCs), immune system, leukemia, leukemia stem cells (LSCs), mesenchymal stem cells (MSCs), stem cell therapies

Abbreviations

acute myeloid leukemia, AML; bone marrow, BM; cancer stem cells, CSCs; chimeric antigen receptors, CARs; extracellular vesicles, EVs; graft-versus-host disease, GVHD; graft-versus-leukemia, GVL; hematopoietic stem cells, HSCs; hematopoietic stem and progenitor cells, HSPCs; hematopoietic stem cell transplantation, HSCT; immune environment diversity, IED; induced pluripotent stem cells, iPSCs; interferon-gamma, IFN- γ ; juvenile myelomonocytic leukemia, JMML; leukemia stem cells, LSCs; mesenchymal stromal cells, MSCs; myelodysplastic syndromes, MDS; promyelocytic leukemia protein, Pml; reactive oxygen species, ROS; toll-like receptor, TLR; tregs, T cells; umbilical cord blood, UCB

Introduction

Stem cells are essential for maintaining and regulating the hematopoietic and immune systems. Hematopoietic stem cells (HSCs) produce all blood cells and reside in the bone marrow throughout life. Factors such as aging, reduces HSCs' regenerative potential, leading to increased susceptibility to leukemia and other hematopoietic disorders (Shevyrev et al., 2023).

Leukemia arises from mutations in HSCs, with leukemia stem cells (LSCs) driving disease progression and resisting treatment (Clara et al., 2020). Stem cell therapies, including hematopoietic stem cell transplantation (HSCT) and CAR-T cell therapy, offer promising treatments but face challenges due to patient variability and stem cell heterogeneity (Putnam et al., 2023; Brown, 2022).

Aging complicates these relationships further, causing immunosenescence and chronic inflammation, which promote leukemic cell survival (Chen et al., 2024). This review explores the interplay between stem cells, the immune system, leukemia, and aging, focusing on roles in hematopoiesis, the impact of aging, leukemia progression, and therapeutic strategies. Understanding these interactions is crucial for advancing treatments for hematological diseases.

Role of Stem Cells in Hematopoiesis and Immune Regulation

Stem cells play a pivotal role in the maintenance and regulation of both the hematopoietic system and the immune system throughout an individual's life. HSCs are the foundation of hematopoiesis, the process by which all blood cells are produced. These stem cells originate from the dorsal aorta region during early embryogenesis and migrate to the fetal liver before finally settling in the bone marrow, where they remain for the rest of an individual's life (Shevyrev et al., 2023). HSCs maintain hematopoiesis via asymmetric division and self-renewal, producing multipotent and unipotent precursors that replenish specialized blood and immune cells. This regenerative potential is particularly high in embryonic HSCs, which can produce numerous offspring and repopulate all blood cell lines, unlike their adult counterparts (Shevyrev et al., 2023). Embryonic HSCs can produce 600-1600 functional daughter HSCs when transplanted into immunodeficient mice. In contrast, adult HSCs in bone marrow typically divide 3-4 times over 2-3 years, maintaining a predominantly dormant state (Shevyrev et al., 2023).

The bone marrow niche provides essential signals through cell-to-cell contact and secreted factors that regulate HSC survival, self-renewal, and differentiation. These interactions are crucial for the proper functioning of HSCs and, consequently, the immune system (Riether et al., 2014). Mesenchymal stromal cells (MSCs), which are part of the bone marrow niche, contribute to this regulatory environment by influencing the induction and function of regulatory T cells (Tregs), thereby playing a significant role in immune modulation (Corradi et al., 2022). MSCs have immunomodulatory properties, meaning they can influence the immune system in both suppressive and stimulatory ways. They interact with various immune cells, including T cells, B cells, and antigen-presenting cells, through direct contact and secreted factors such as TGF- β and HGF. These interactions help in maintaining immune tolerance and preventing excessive immune responses, which is crucial for the survival of transplanted tissues and the overall regulation of the immune system (Bao and Wu, 2017; Geoffrey Brown, 2016; Clara et al., 2020).

HSCs are also involved in the inflammatory responses of the immune system. Hematopoietic stem and progenitor cells (HSPCs) can adopt inflammatory gene expression programs, especially when exposed to extracellular vesicles derived from acute myeloid leukemia (AML) cells. This exposure can trigger the upregulation of inflammatory genes such as Cxcl10, Ifn- α , Il-6, and Isg15, indicating that HSPCs play a role in the inflammatory adaptation of the bone marrow niche during leukemic infiltration (Chen et al., 2024). The dynamic process of hematopoiesis is tailored to meet both steady-state and emergency needs, such as infection or bleeding. Cytokines like IL-3, IL-6, G-CSF, and GM-CSF play crucial roles in lineage fate

determination and hematopoiesis during emergencies, directing HSCs to generate specific blood cell types as required (Brown, 2022).

Induced pluripotent stem cells (iPSCs) have been utilized to model various hematological diseases, including pediatric leukemias, providing valuable insights into hematopoiesis and immune regulation. iPSCs, derived from somatic cells, can differentiate into various cell types, including HSCs and immune cells. Studies have shown that iPSCs can be reprogrammed to retain disease-specific genetic alterations, making them a valuable tool for understanding the mechanisms of leukemic transformation and the role of stem cells in hematopoiesis (Bertuccio et al., 2022). For example, proteomic analysis of myeloid cells derived from iPSCs from Noonan syndrome (NS) patients with PTPN11 mutations revealed significant perturbations in pathways associated with TP53 and NF- κ B signaling. These mutations, frequently associated with juvenile myelomonocytic leukemia (JMML), highlight the critical role of these pathways in HSC regulation and differentiation capabilities (Pearson et al., 2019).

The interactions between HSCs and the immune system are bidirectional. Immune cells, particularly those within the bone marrow niche, create and maintain the environment necessary for HSC development and function. This includes both soluble factors and direct cell-to-cell interactions that ensure the survival and proper differentiation of HSCs (Aurora & Olson, 2014). For instance, senescent-like bone marrow CD8⁺ T cells exhibit markers such as CD57 and γ -H2AX and have decreased expression of activation and proliferation markers when in contact with AML blasts. This indicates that interactions within the bone marrow niche can influence both stem cell behavior and immune cell function, particularly in the context of leukemic diseases (Rutella et al., 2022).

HSCs are integral to both hematopoiesis and immune regulation. They ensure the continuous regeneration of blood cells and play a crucial role in immune responses. The bone marrow niche and the interactions with mesenchymal stromal cells and other immune cells provide the necessary support and regulatory signals for HSC function. Understanding these complex interactions and the role of stem cells in immune modulation is essential for developing new therapeutic strategies for hematological diseases and improving stem cell transplantation outcomes.

Impact of Aging on Stem Cells and the Immune System

Aging significantly impacts the regenerative potential of hematopoietic stem cells (HSCs), leading to decreased self-renewal ability and differentiation potential. The accumulation of mutations and epigenetic changes in HSCs with age disrupts hematopoiesis and immune function, causing a shift from lymphopoiesis to myelopoiesis and a decrease in clonal diversity. This shift is often accompanied by an increase in myeloid cells and a decline in lymphoid cells, contributing to immunosenescence—a decline in immune function characterized by diminished adaptive immune responses and increased inflammation.

The age-related decline in HSC function and numbers significantly affects hematopoiesis and immune responses. Aging HSCs show a 5-fold decrease in repopulation efficiency and a

4-fold decrease in homing ability (Shevyrev et al., 2023). As HSCs age, their ability to self-renew diminishes due to DNA damage, oxidative stress, and chronic inflammation. The accumulation of DNA damage in HSCs leads to increased risk of hematopoietic clonality and proliferative diseases such as leukemia. Aging HSCs accumulate around 17 mutations annually (Shevyrev et al., 2023). Telomere shortening, a common feature in aging cells, results in a loss of approximately 30 base pairs per year in HSCs, further impairing their regenerative capacity by limiting their ability to divide and replenish the hematopoietic system (Shevyrev et al., 2023).

Epigenetic modifications, such as global DNA hypermethylation in aging HSCs, reduce their regenerative potential and contribute to myeloid bias. This bias towards myeloid lineage over lymphoid lineage leads to an increased production of myeloid cells at the expense of lymphoid cells, thereby compromising the adaptive immune response. Additionally, transcriptomic alterations and decreased autophagy in aging HSCs contribute to their functional decline, impairing hematopoiesis and reducing the overall efficiency of the immune system.

Aging also affects the immune system through a process known as immunosenescence, which is characterized by a decline in the production of naïve T cells and an increase in memory T cells. Thymic involution, or the shrinkage of the thymus with age, significantly reduces the production of naïve T cells, further compromising the adaptive immune response. This reduction in naïve T cells impairs the immune system's ability to respond to new antigens, increasing susceptibility to infections and malignancies like leukemia .

Oxidative stress and the accumulation of reactive oxygen species (ROS) in aging cells lead to immune cell damage and chronic inflammation, exacerbating the decline in immune function . The inflammatory state in aging stem cells is characterized by increased production of pro-inflammatory cytokines, which can disrupt hematopoiesis and contribute to leukemogenesis . In aged individuals, HSPCs become more susceptible to inflammatory stimuli, which can exacerbate age-related declines in immune function and promote the progression of hematologic malignancies such as myelodysplastic syndromes (MDS) and acute myeloid leukemia (AML).

The aging bone marrow microenvironment also plays a crucial role in the decline of HSC function. The senescent immune microenvironment, characterized by an increased presence of senescent cells and a chronic inflammatory state, negatively impacts HSC function and contributes to the development of hematologic diseases. Senescent-like T cells in the bone marrow of AML patients correlate with impaired cytotoxicity against AML blasts and shorter overall survival, highlighting the impact of an aged immune system on disease prognosis and therapeutic outcomes .

In summary, aging has a profound impact on stem cells and the immune system, leading to reduced regenerative potential of HSCs, impaired hematopoiesis, and compromised immune responses. The accumulation of DNA damage, oxidative stress, and chronic inflammation in aging HSCs disrupts their function and increases the risk of hematopoietic clonality and malignancies. Immunosenescence, characterized by a decline in naïve T cells and increased inflammatory responses, further exacerbates the decline in immune function and increases susceptibility to infections and hematologic diseases. Understanding these age-related changes is

crucial for developing strategies to mitigate the effects of aging on the hematopoietic and immune systems and improve outcomes for elderly patients with hematologic malignancies.

Leukemia and Stem Cells: Pathogenesis and Progression

Leukemia is a malignancy characterized by the uncontrolled proliferation of abnormal blood cells originating from hematopoietic stem cells (HSCs). HSCs are responsible for the production of all blood cell types, and mutations within these cells can disrupt normal hematopoiesis, leading to leukemia (Clara et al., 2019). Leukemia stem cells (LSCs), which share many features with HSCs, including reliance on signals from the bone marrow (BM) niche for survival and growth, play a crucial role in sustaining the disease. Similar to HSCs, LSCs depend on the BM microenvironment and can be stimulated by immune responses, such as interferon-gamma (IFN- γ) secreted by activated T cells during infection, which promotes the proliferation of both HSCs and LSCs in mouse models (Riether et al., 2014). This interaction highlights a potential paradoxical role of the immune system in leukemia progression, as immune responses that typically combat infections may inadvertently create conditions conducive to leukemia development (Riether et al., 2014).

Genetic and epigenetic alterations in HSCs are pivotal in the pathogenesis of leukemia. Mutations in genes such as DNMT3A, TET2, and ASXL1, which are commonly associated with clonal hematopoiesis, increase the risk of leukemia by promoting abnormal proliferation and differentiation of hematopoietic cells (Shevyrev et al., 2023). In juvenile myelomonocytic leukemia (JMML), somatic gain-of-function mutations in the RAS/MAPK signaling pathway, including genes like NF1, KRAS, PTPN11, and CBL, lead to constitutive activation of various signaling pathways, contributing to leukemogenesis (Pearson et al., 2019). Proteomic analyses in JMML have identified significant alterations in proteins involved in leukocyte migration and cell motility, further elucidating the complex cellular changes underpinning the disease (Pearson et al., 2019).

The BM microenvironment plays a critical role in leukemia progression. MSCs and other components of the BM niche provide essential support for leukemic cells, promoting their survival and proliferation. For instance, IFN- γ released by acute myeloid leukemia (AML) cells induces an immune-regulatory program in MSCs, leading to an immunotolerant BM microenvironment enriched with regulatory T cell, which supports leukemia progression (Corradi et al., 2022). Moreover, the expression of promyelocytic leukemia protein (Pml) in MSCs has been shown to facilitate leukemic cell survival, and genetic deletion of Pml in MSCs improves survival in leukemia mouse models by reducing pro-inflammatory molecules and enhancing chemotherapy effectiveness (De Alvarenga et al., 2018).

Leukemia stem cells (LSCs) are particularly challenging to eradicate due to their resistance to conventional therapies and their role in disease relapse. Oncogenes such as MYC, BCL2, and members of the RAS family are frequently mutated in leukemias, leading to increased cell proliferation and survival (Brown, 2022). These mutations drive oncogenic lineage restriction, where specific oncogenes restrict LSCs to single lineages, contributing to the

monoclonal expansion characteristic of leukemia (Brown, 2022). Additionally, the overexpression of surface markers like VCAM1 on LSCs correlates with poor prognosis in AML, as it aids in immune evasion and disease progression (Pinho et al., 2022).

Chronic inflammation within the BM niche also plays a significant role in leukemogenesis. Inflammatory cytokines and immune cells within the BM can create a supportive environment for leukemic cells, promoting their growth and survival. For example, IFN- γ not only supports leukemic cell survival but also contributes to the formation of an immunosuppressive microenvironment that impairs effective anti-tumor immune responses (Corradi et al., 2022). Senescent-like CD8⁺ T cells and higher immune dysfunction markers in AML patients are associated with poorer responses to chemotherapy and shorter overall survival, underscoring the interplay between immune dysfunction and leukemia progression (Rutella et al., 2022).

Leukemia progression involves a complex interplay of genetic mutations, epigenetic changes, and interactions with the BM microenvironment. These factors collectively disrupt normal hematopoiesis, leading to the proliferation of malignant cells. The BM microenvironment, including MSCs and inflammatory cytokines, plays a crucial role in supporting leukemic cells and fostering an environment that promotes disease progression (Shevyrev et al., 2023; Corradi et al., 2022). Understanding these intricate mechanisms is essential for developing more effective therapeutic strategies aimed at targeting both the leukemic cells and their supportive microenvironment.

Stem Cell Therapies and Immune Modulation in Leukemia Treatment

Stem cell therapies, particularly hematopoietic stem cell transplantation (HSCT), and immune modulation strategies, such as CAR-T cell therapy and mesenchymal stem cell (MSC) applications, have revolutionized the treatment landscape for leukemia. These therapies leverage the regenerative and immune-modulatory capabilities of stem cells to restore hematopoiesis and enhance anti-leukemia immune responses.

Hematopoietic Stem Cell Transplantation (HSCT)

HSCT remains a cornerstone treatment for various leukemias, including acute myeloid leukemia (AML) and high-risk myelodysplastic syndromes (MDS) (Putnam et al., 2023). This therapeutic approach involves the transplantation of healthy hematopoietic stem cells (HSCs) to replace the patient's diseased hematopoietic system. The regenerative potential of HSCs from umbilical cord blood (UCB) and fetal liver is particularly high, making them promising sources for HSCT (Shevyrev et al., 2023). Despite its potential to cure leukemia, HSCT is associated with significant challenges such as graft-versus-host disease (GVHD) and relapse, which necessitate strategies to enhance graft-versus-leukemia (GVL) effects while minimizing GVHD (Li N et al., 2017).

Recent advancements have focused on modulating the immune microenvironment to improve HSCT outcomes. The immune modulation by interferon-gamma (IFN γ) and regulatory

T cells significantly impacts the success of transplantation (Corradi et al., 2022). Targeting the IFN γ -IDO1 pathway, crucial for Treg induction, using IDO1 inhibitors, may reduce immunosuppression in the bone marrow (BM) microenvironment and enhance AML treatment effectiveness (Corradi et al., 2022). Additionally, proteomic analysis has identified potential drug targets, such as the TP53 and NF- κ B pathways, which, when inhibited, show promising results in reducing colony formation of JMML iPSC-derived hematopoietic cells (Pearson et al., 2019).

CAR-T Cell Therapy

CAR-T cell therapy, involving the engineering of T cells to express chimeric antigen receptors (CARs) targeting specific leukemia antigens, has shown remarkable promise, particularly in treating refractory and relapsed B-cell malignancies (Brown, 2022). Clinical trials are exploring CAR-T therapies targeting antigens such as CD7, CD33, and CD123 in MDS and AML, showing potential in overcoming resistant leukemias (Putnam et al., 2023). This therapy not only targets leukemia cells but also has the potential to induce long-lasting remissions by harnessing the body's immune system.

Combining CAR-T cell therapy with HSCT or other immunomodulatory approaches is being investigated to enhance the efficacy and durability of responses (Li N et al., 2017). For example, integrating CAR-T cells with HSCT aims to provide a more robust anti-leukemia effect while ensuring hematopoietic recovery. Additionally, senescence reversal strategies are proposed to reinvigorate T cells, potentially improving responses to CAR-T therapy and other immunotherapies in AML (Rutella et al., 2022).

MSC-Based Therapies

Mesenchymal stem cells (MSCs) are explored for their immune-modulatory properties and potential to support hematopoiesis and ameliorate GVHD post-HSCT (Brown, 2022). MSCs secrete a variety of extracellular vesicles (EVs) and soluble factors, such as TGF- β , IL-10, and PGE2, which play crucial roles in immune modulation and tissue regeneration (Li N et al., 2017). These properties make MSCs a valuable adjunct in leukemia treatment, particularly in managing the complications associated with HSCT.

MSC-based therapies are also being evaluated for their ability to reduce inflammation and enhance the GVL effect. The therapeutic benefits of drugs like CBL0137, which preferentially extinguish primitive hematopoietic cells from sporadic JMML patients, underscore the potential of targeted MSC-based therapies (Pearson et al., 2019). This drug's ability to induce apoptosis in leukemic cells while sparing healthy cells highlights its therapeutic potential, demonstrating the efficacy of combining targeted therapies with MSC-based interventions.

Immune Checkpoint Inhibitors

Immune checkpoint inhibitors, such as ipilimumab and nivolumab, are being tested in MDS and AML but have shown limited success as monotherapies (Putnam et al., 2023). However, combination therapies involving these inhibitors are ongoing, aiming to enhance their

efficacy by integrating them with other treatments like chemotherapy and CAR-T cell therapy. Immune checkpoint blockade targeting PD1/PDL1 interactions shows effectiveness in enhancing anti-leukemia immune responses, highlighting the need for integrated therapeutic approaches (Sultan et al., 2016).

Therefore, the integration of stem cell therapies and immune modulation offers a multifaceted approach to leukemia treatment. HSCT, CAR-T cell therapy, MSC-based therapies, and immune checkpoint inhibitors each play a crucial role in enhancing hematopoietic recovery and targeting leukemic cells. Future research should focus on optimizing these therapies' efficacy, minimizing associated complications, and exploring novel combinations to improve patient outcomes in leukemia treatment.

Aging, Immune System, and Leukemia: Interconnected Pathways

Aging significantly impacts both the immune system and the risk of developing leukemia through various interconnected pathways. As individuals age, the decline in immune function, known as immunosenescence, leads to a reduced ability to monitor and eliminate malignant cells, thus increasing the incidence of leukemia and other hematological malignancies (Shevyrev et al., 2023). For example, studies show that the frequency of leukemia increases with age, with individuals over the age of 65 being at least five times more likely to develop acute myeloid leukemia (AML) than younger individuals (Shevyrev et al., 2023).

Chronic inflammation, or inflammaging, exacerbates the aging process by creating a pro-inflammatory environment that promotes leukemic cell survival and proliferation. This environment is characterized by increased levels of inflammatory cytokines, such as a 2-3 fold increase in IFN- γ and TNF- α in the bone marrow microenvironment of older individuals compared to younger ones (Chen et al., 2024). These elevated cytokine levels further support the transformation of hematopoietic stem cells (HSCs) into leukemic stem cells (LSCs) (Chen et al., 2024).

The aging bone marrow (BM) niche also plays a crucial role in leukemogenesis. As individuals age, the BM microenvironment undergoes significant changes, including a 30-40% increase in adiposity and altered cytokine profiles, which create a permissive environment for leukemic transformation and progression (Li et al., 2017). These alterations disrupt the delicate balance of HSC niches, facilitating the establishment of an inflammatory niche conducive to leukemia development. Furthermore, the accumulation of genetic mutations in HSCs with age increases the risk of clonal hematopoiesis, a precursor to leukemia, by approximately 10% per decade after the age of 50 (Brown, 2022).

In addition to these environmental changes, aging affects the immune system's functionality. Age-related immune dysregulation, including a 50% decrease in the production of naïve T cells and a 2-3 fold increase in memory T cells, heightens susceptibility to leukemia (Yeo et al., 2021). T cell senescence, characterized by impaired activation and increased production of inflammatory cytokines, further compromises the immune system's ability to eliminate leukemic cells. Studies have shown that preexisting and chemotherapy-induced

senescent-like T cells contribute to poor clinical outcomes in AML, with a 20-30% reduction in overall survival rates in patients with high levels of senescent T cells (Rutella et al., 2022).

The aging immune system's reduced efficacy in immune surveillance allows malignant cells to proliferate unchecked, increasing leukemia incidence by approximately 50% in individuals over the age of 60 compared to younger cohorts (Shevyrev et al., 2023). Inflammatory signaling pathways become dysregulated with age, promoting leukemogenesis. For instance, mutations in the Ras/MAPK pathway in juvenile myelomonocytic leukemia (JMML) are linked to aging processes and immune system dysregulation, highlighting the interconnectedness of aging and leukemia development (Bertuccio et al., 2022).

Moreover, the aging process induces changes in the BM microenvironment that support leukemic cell survival and proliferation. Inflammatory pathways, including those mediated by IFN- γ , play a significant role in the leukemic transformation of HSPCs in aged individuals (Chen et al., 2024). The chronic inflammatory state of the aging BM niche contributes to the establishment of an environment that favors leukemia development. This proinflammatory state, coupled with the accumulation of genetic mutations in HSCs, drives the progression of leukemia, with older patients showing a 3-4 times higher rate of progression from clonal hematopoiesis to overt leukemia compared to younger patients (Putnam et al., 2023).

Senescent cells, which accumulate with age, also contribute to the pro-inflammatory environment in the BM niche. These cells secrete pro-inflammatory cytokines that promote leukemic cell survival and proliferation (Silver et al., 2015). Regulatory T cells suppress immune attacks on tumors, including leukemia, by promoting an immunosuppressive environment that facilitates tumor invasion (Riether et al., 2014). Leukemic stem cells (LSCs) can evade immune detection through mechanisms such as expressing molecules that inhibit T cell function and utilizing VCAM1-mediated 'don't-eat-me' signals, which are overexpressed in 60-70% of AML cases, contributing to immune evasion and poorer prognosis (Pinho et al., 2022).

Overall, the interplay between aging, the immune system, and leukemia is complex and multifaceted. Aging induces a decline in immune function and creates a pro-inflammatory environment that promotes leukemogenesis. Strategies to counteract the effects of aging on the immune system and stem cell function, such as targeting inflammatory pathways and enhancing immune modulation, are essential for improving outcomes for leukemia patients (Putnam et al., 2023). Understanding these interconnected pathways is crucial for developing novel therapeutic approaches to treat leukemia in the aging population.

Future Directions and Emerging Therapies

The field of stem cell research and its applications in treating leukemia is rapidly evolving, with several promising avenues under exploration. One of the most exciting developments is the use of senolytic drugs, which target and eliminate senescent cells. Research has shown that senolytics can rejuvenate aging hematopoietic stem cells (HSCs), potentially restoring their regenerative capacity and delaying the effects of aging (Shevyrev et al., 2023). This approach not only aims to enhance stem cell function but also to improve immune

responses, which is particularly beneficial for elderly leukemia patients whose immune systems are often compromised.

Genetic and epigenetic therapies are also at the forefront of leukemia treatment. Techniques like CRISPR-Cas9 and small molecule inhibitors are being developed to specifically target genetic abnormalities in leukemia stem cells (LSCs), offering more precise and effective treatments (Brown, 2022). Personalized medicine, which involves genomic profiling of patients' leukemias, is another promising area. By tailoring treatments to the individual genetic landscapes of patients, these personalized approaches can significantly improve outcomes.

Hematopoietic stem cell transplantation (HSCT) remains a cornerstone of curative treatment for leukemia. However, the success of HSCT largely depends on factors such as patient age and the degree of immune system matching between donor and recipient (Pearl et al., 2012). Recent studies are exploring the use of mesenchymal stem cells (MSCs) for immunomodulatory therapy in leukemia, given their potential to regulate the immune response and reduce complications like graft-versus-host disease (GVHD). Although early results are promising, further research is needed to fully establish the long-term safety and efficacy of MSC therapy in leukemia treatment.

Innovative immunotherapies are also being developed. CAR-T cell therapy, which involves genetically modifying T cells to target leukemia cells, has shown remarkable success in clinical trials (Aurora & Olson, 2014). Researchers are now investigating combination therapies that integrate CAR-T cells with other treatments such as immune checkpoint inhibitors and vaccines. These combination approaches aim to enhance the immune response against leukemia and improve patient outcomes (Putnam et al., 2023).

Personalized immunotherapies, guided by individual immune environment diversity (IED) scores, are another promising avenue. These therapies are designed to identify patients most likely to benefit from specific immunotherapies, thereby optimizing treatment efficacy (Rutella et al., 2022). In addition, the development of novel biomarkers based on IED gene signatures offers new tools for predicting treatment responses and tailoring therapies to individual patients.

Another exciting area of research is the targeting of innate immune signaling pathways. Drugs that modulate Toll-like receptor (TLR) signaling, such as CX-01 and OPN-305, are being explored for their potential to treat myelodysplastic syndromes (MDS) and acute myeloid leukemia (AML) by modulating inflammatory responses (Putnam et al., 2023). These approaches aim to enhance the body's innate immune defenses and improve the effectiveness of existing treatments.

Additionally, strategies to delay aging and improve stem cell function are being actively pursued. Interventions targeting cellular senescence, enhancing mitochondrial function, and modulating the bone marrow microenvironment hold promise for maintaining the health and function of HSCs as they age (Li N et al., 2017). These approaches not only aim to extend the lifespan of healthy stem cells but also to reduce the incidence of age-related diseases, including leukemia.

Finally, the identification of novel therapeutic targets, such as VCAM1, which plays a role in leukemia progression, offers new opportunities for treatment. Inhibition of VCAM1 has been shown to reduce leukemia burden and extend survival in animal models, and combination treatments with chemotherapy are being explored to enhance these effects (Pinho et al., 2022).

Therefore, the future of leukemia treatment lies in a multifaceted approach that combines genetic and epigenetic therapies, personalized medicine, advanced immunotherapies, and strategies to rejuvenate aging stem cells. These emerging therapies hold great promise for improving patient outcomes and advancing our understanding of leukemia and stem cell biology.

Expected Challenges in Data Variability

The heterogeneity of stem cell populations and leukemia subtypes presents a significant challenge in the field of stem cell research and therapy. Hematopoietic stem cells (HSCs) are known for their variability in terms of aging processes and regenerative potential, which complicates the development of standardized therapeutic approaches and the prediction of treatment outcomes (Shevyrev et al., 2023). This heterogeneity extends to the clinical setting, where differences in genetic and environmental factors among patients necessitate the creation of personalized treatment strategies. Such variability not only affects the clinical efficacy of stem cell therapies but also hinders the establishment of universal markers and mechanisms that could be applied across different patient populations (Brown, 2022).

A major source of variability in stem cell research is the differences in methodologies used across various studies. These methodological inconsistencies can lead to significant variations in study outcomes, making it difficult to draw reliable comparisons and conclusions. For instance, the protocols for isolating, expanding, and administering mesenchymal stem cells (MSCs) differ widely, leading to variability in their immunomodulatory and regenerative capacities (Li N et al., 2017). Establishing standardized clinical protocols for MSC isolation and administration is crucial to reducing this variability and ensuring reproducibility and efficacy in MSC-based therapies (Li N et al., 2017).

Patient-to-patient variability is another critical challenge. Factors such as the patient's genetic background, disease state, and bone marrow microenvironment can significantly influence the effectiveness of stem cell therapies (Aurora & Olson, 2014). For example, variations in the bone marrow niche between patients can lead to different therapeutic outcomes, highlighting the need for personalized approaches (Brown, 2022). This variability is also evident in leukemia treatments, where the molecular and clinical heterogeneity of acute myeloid leukemia (AML) poses significant challenges in standardizing treatment responses and outcomes (Rutella et al., 2022). Differences in immune cell infiltration and dysfunction across patients further complicate the assessment of treatment efficacy, necessitating robust biomarkers for precise stratification and personalized AML therapy (Rutella et al., 2022).

The variability in clinical outcomes of stem cell therapies and immunotherapies is compounded by external factors such as the COVID-19 pandemic, which has affected patient recruitment and response monitoring in clinical trials (Putnam et al., 2023). Additionally,

managing the toxicities associated with advanced therapies like CAR-T cell therapy remains a significant challenge. Life-threatening side effects such as cytokine release syndrome and immune cell-associated neurotoxicity syndrome need to be carefully managed to ensure patient safety and therapy efficacy (Putnam et al., 2023).

Another layer of complexity arises from the identification and targeting of cancer stem cells (CSCs) and leukemia stem cells (LSCs). The identification of CSCs based on surface markers varies across different cancer types, making it difficult to standardize therapies (Sultan et al., 2016). Furthermore, differences in immune cell interactions and the tumor microenvironment across patients complicate the development of universal treatments. This is particularly challenging in the context of therapeutic resistance and relapse, where CSCs and LSCs exhibit resilience to conventional treatments and can evade immune detection, leading to disease recurrence (Sultan et al., 2016).

Moreover, induced pluripotent stem cells (iPSCs), which were initially thought to bypass immune rejection issues, have shown variability in immunogenicity based on their source and the genes used for reprogramming (Pearl et al., 2012). Recent studies indicate that iPSCs can still be targeted by the immune system, which underscores the importance of understanding the factors that influence their immunogenicity to develop more effective stem cell therapies (Pearl et al., 2012).

In research, the reproducibility of findings across different laboratories and clinical settings remains a significant hurdle. Ensuring reproducibility is essential for the development and implementation of new therapies, but it is often hindered by inconsistencies in experimental conditions and outcome measures (Brown, 2022). Standardizing protocols and outcome measures is critical for accurately assessing the efficacy of stem cell therapies and ensuring that findings can be reliably reproduced and applied in clinical practice (Aurora & Olson, 2014).

Therefore, addressing the challenges posed by data variability in stem cell research requires a multifaceted approach. This includes acknowledging the inherent heterogeneity of stem cell populations and leukemia subtypes, standardizing methodologies and clinical protocols, and developing personalized treatment strategies based on robust biomarkers. By applying stringent inclusion and exclusion criteria for reviewed studies and focusing on relevant keywords, researchers can better navigate these complexities and contribute to more consistent and reliable advancements in the field.

Conclusion

This review underscores the significant role of hematopoietic stem cells (HSCs) in maintaining hematopoiesis and regulating the immune system, with particular focus on the impacts of aging and the development of leukemia. Key findings highlight how age-related declines in HSC function and the resultant chronic inflammation exacerbate leukemia progression, complicating treatment efforts. Stem cell therapies, including hematopoietic stem cell transplantation (HSCT) and CAR-T cell therapy, show promise but face significant challenges due to patient variability and stem cell heterogeneity. Our research emphasizes the

necessity of developing targeted treatments that cater to the specific needs of aging patients, integrating novel approaches like senolytic drugs and personalized immunotherapies to enhance efficacy and reduce relapse risk. Future research should prioritize understanding the molecular mechanisms of HSC aging and leukemogenesis, aiming to rejuvenate aged stem cells and improve immune function, ultimately advancing therapeutic strategies for hematological malignancies.

Political Decision Making: Integrating Perspectives From Behavioral Economics, Personality Psychology, and Neuroscience By Brandon Phan

Abstract

Politics is a field long dominated by individuals with shared traits and behaviors. While much research has examined politics at a macroscopic, socio-political level, mechanisms underpinning political decisions and behaviors are understudied. The review focuses on understanding decision-making tendencies and personality types that characterize politicians. Further, this review will shed light on the limited neuroscience literature that may provide insight into how the qualities of successful politicians are encoded beneath the skin.

Introduction

What characteristics define a politician? Can we use tools from neuroscience to more precisely understand political decision-making? A broad literature in personality and cognitive psychology suggests politicians share a combination of unique traits (e.g., trustworthiness, stability, and extraversion) and behaviors (e.g., communication skills, performance under pressure) that may not be as common in the rest of the population. Political leadership comes with high-stakes decision-making—indeed, their choices affect and should reflect the values of all of whom they govern. Further, there is increasing interest in identifying neuroendocrinological underpinnings that characterize a politician, which may clarify the biological foundation of long-standing stereotypes about this niche group and predict policy decisions. This brief review seeks to highlight our current understanding of how biology and personality interact to produce influential politicians.

Modeling decision-making in politicians

Political leaders often make critical decisions that have a direct effect on the progress of their nations. Decision-making has long been investigated in correspondence with theoretical models. For instance, *Game Theory* involves looking at how rational individuals make decisions when they are mutually independent. An optimal decision is influenced by a prediction of an opponent's decisions, determining whether to cooperate or act non-cooperatively (Romp, 1997; Fudenberg & Tirole, 1991). *Rational Choice Theory* represents a cost-benefit analysis and relies on people being fundamentally “rational,” that is, maximizing reward and minimizing loss (Scott, 2000). Based on these foundational principles, a theory specific to leadership has emerged—*Poliheuristic Choice Theory*.

Poliheuristic choice theory

In 1954, during the First Indochina War and the Cold War, Dwight D. Eisenhower and the United States faced a crucial decision—should they assist France in its struggle against the Viet Minh, a Communist coalition fighting for independence from French colonial rule? Eisenhower's decisions during this conflict are well explained by a broad exploration of potential outcomes

and their corresponding alternatives, as well as the motivation to minimize loss; this decision process is known to many researchers as Poliheuristic Choice Theory. *Poliheuristic* can be broken down into its roots: *poly* means “many” and *heuristic* means “shortcuts.” Thus, the theory provides a parsimonious cognitive path that leaders or political figures may employ to resolve complex decisions (Mintz et al., 1997).

According to Poliheuristic Choice Theory, simplifying difficult political decisions involves a two-stage process: an initial non-compensatory analysis stage followed by a secondary compensatory analysis stage. The non-compensatory analysis stage of Poliheuristic Choice Theory involves a nonholistic search, pursuing potential options or alternatives to a problem. Once choices are established, they are narrowed down by a noncompensatory analysis, seeking to eliminate options based on cognitive shortcuts, which are automatic thought patterns that individuals use to make decision-making more efficient (Bogetz, 2021). These cognitive shortcuts, or heuristics that politicians use, can vary from person to person; however, the most common ones include status quo bias and confirmation bias, loss aversion, political party alignment, and the effects of the decision on their political career. In this stage, being noncompensatory is a core principle in which significant losses on a key dimension cannot be substituted with potential gains on other dimensions (Goertz, 2004). Thus, politicians are likely to reject any options with high political costs despite the fact that the same choice potentially yields high benefits in other dimensions (Mintz, 2004). This stage of PHT reflects the cognitive aspect of decision-making, where heuristics help manage the overwhelming amount of information and complexity inherent in political decisions.

Once the initial set of options has been reduced via noncompensatory analysis, the individual then rationally evaluates the remaining choices. Specifically, the second phase involves a maximizing decision rule for selecting the remaining choices following the first stage of PHT (Mintz et al., 1997). In other words, surviving choices following the noncompensatory stage of PHT are then evaluated using compensatory analysis for minimum risk and maximum reward. Here, the rational approach theory comes into play, as it assumes that individuals have access to all relevant information and are directly seeking to maximize their rewards.

Decisions made during the Dien Bien Phu crisis reflect the PHT model of decision-making and its two stages of option elimination. The status quo option was selected because it passed Eisenhower’s mental shortcuts and political dimensions in the first stage and proved to be the choice that would reap the maximum benefit with minimal loss in the second phase. With such insight into a successful application of PHT, its relevance in the political world is now well recognized.

Political personalities and their influence on decision-making

While political success is often attributed to policies and strategies, some work has found personality traits to influence the success of many politicians. For convenience, psychologists have used the Big Five personality traits, which is a well-validated scale that captures openness

to experience, conscientiousness, extraversion, agreeableness, and neuroticism (Caprara et al., 2003).

The Big Five personality traits: a five-factor framework

In the last three decades, the “Big 5” framework for measuring personality traits has dominated the field of personality psychology due to its high interpretability and strong psychometric properties. They are considered dispositional or core traits, distinguishing them from those that are dynamic across the lifespan. These traits are at the core of heterogeneity across individuals and provide important insights into how and why we respond to our environment and make decisions in the way that we do. An emerging literature on politicians and their corresponding personalities suggests that politicians share a unique personality profile. Florczak (2020) found politicians are more extraverted compared to non-politicians, which is characterized by sociability and assertiveness. They are also shown to be higher in the dimensions of conscientiousness, openness, and agreeableness. Only in the dimension of neuroticism do politicians exhibit lower scores.

Extraversion is characterized by sociability, assertiveness, and a desire for social interaction. Extraverted individuals often desire a career in politics, and those with higher levels are more likely to consider running for office (Blais & Pruyers, 2017; Dynes et al., 2019). When asked about politicians' personalities, people often reduce their ratings to two factors: extraversion and agreeableness (Gerber et al., 2011). According to Caprara (1997), these two traits were found to be the primary anchors for votes in evaluating the characters of politicians in elections in both the United States and Italy. As mentioned, politicians tend to score higher on levels of extraversion, enabling them to engage with voters, lead debates, and maintain a robust public presence (Florczak, 2020).

Conscientiousness encompasses traits such as responsibility, organization, and dependability. It is shown to have a positive correlation to self-discipline, and those who score high on it tend to be attracted to social norms and strive for achievement. In politics, these traits mean that politicians high in conscientiousness are more likely to reject challenges to social norms, making them more likely to be attracted to conservative or right-wing ideology (Gerber et al., 2011).

Openness to experience is characterized by intellectual curiosity, creativity, and a willingness to embrace new ideas. Similar to extraversion, openness was found to be positively related to political ambition, meaning that high-scoring individuals tend to pursue a career in politics and run for office (Blais and Pruyers, 2017). As individuals higher in openness tend to be more creative and willing to try new ideas, they may be less inclined to follow the political mantra of 'sticking to the message,' leading to creative campaigning methods and more nuanced political ideologies.

Agreeableness involves traits such as compassion, cooperativeness, and respect. As mentioned before, agreeableness is one of the two traits that people consider when evaluating a politician's personality alongside extraversion. Frequently, agreeableness and extraversion have a

positive relationship with each other and go hand in hand. In a survey conducted by Caprara and Zimbardo (2004), politicians were given a Big Five self-assessment, and the results showed that politicians scored higher in both extraversion and agreeableness. In terms of policies, politicians who are higher on agreeableness are more likely to resist those that challenge social norms as they can be seen as threatening harmonious relationships, aligning with elements of conservatism.

Neuroticism, or negative emotionality, represents the tendency in which someone experiences negative emotions or behaviors such as anxiety, anger, or depression. As mentioned before, out of the Big Five, neuroticism is the only trait in which politicians score lower than average civilians (Scott & Medeiros, 2020). This means that politicians, individuals with low neuroticism, are better equipped to manage the pressures of the political theater, which demands the ability to make decisions under massive amounts of stress. Additionally, those who are emotionally stable, the inverse of neuroticism, are found to exhibit the greatest willingness to seek higher offices, similar to that of openness and extraversion (Dietrich et al., 2012), meaning those higher in the political realm tend to exhibit less negative behaviors.

However, how do these traits impact political decision-making? Extensive research into these character traits and how they interact with the political arena has discovered that rather than being directly associated with political attitudes and behaviors, they are instead theorized to have major impacts on responses to the full range of stimuli people face in the world, including politicians (Gerber et al., 2011).

Understanding politician personalities through behavioral economics

In politics, leaders are often faced with making decisions that not only align with personal political agendas and policies, but also reflect the whole—indeed, these two intentions often are conflicting. This is known as a *social dilemma*, or a situation in which an individual's self-interest conflicts with long-term collective interests (Dawes, 1980), and personality has been shown to be predictive of how people resolve these conflicts.

The prisoner's dilemma

Zhao and Smillie (2015) analyzed a series of economic games to analyze the roles of the Big Five traits in navigating decision-making in social dilemmas. The first—the *prisoner's dilemma*—is the most widely recognized economic theory game. Two players have to choose between cooperation or defection, with the former option offering the highest reward for both participants. However, if one of the players were to choose to defect while the other chose to cooperate, the one who defects would receive the highest payout, while the other would be left with minimal to none (Zhao & Smillie, 2015). Experimental studies of this game indicated that players, on average, only cooperated around 50% of the time, with repetition of the game increasing the cooperation rate each time (Sally, 1995). This social game closely mirrors political leaders' situations and choices, such as in the context of international negotiations and alliances, where trust runs thin, and prioritizing short-term gains over long-term benefits may yield serious,

wide-reaching consequences. Like in the game, politicians must choose whether to cooperate or defect, choosing to maintain alliances with other nations versus securing political capital at home.

Research on the prisoner's dilemma suggests personality traits significantly influence how people play the game. In a study of 120 participants (six groups of 20), Lönnqvist, Verkasalo, and Walkowitz (2011) found that higher levels of openness and extraversion were associated with greater cooperation, while higher levels of conscientiousness and neuroticism were linked to lower cooperation rates. Contrastingly, Hirsh and Peterson (2009) observed a positive relationship between neuroticism and cooperation; though, these two studies found similar positive effects of extraversion on cooperation. The difference in findings could be due to methodological differences, such as different methods of experiment. Alternatively, the mixed findings may reflect the multifaceted nature of neuroticism, as this dimension is often associated with risk aversion (Glöckner & Hilbig, 2012). As individuals perceive what is risky differently, higher scores in neuroticism may encourage cooperation in an attempt to avoid conflict or foster defection as a result of uncertainty in trusting others.

Based on these findings, we can infer that politicians scoring higher on extraversion and openness will tend to exhibit cooperative behaviors. In the context of the prisoner's dilemma, they may lean towards decisions that foster alliances with other nations, putting collective interests over personal or national ones. On the other hand, politicians who score higher in conscientiousness—closely related to risk aversion and conservatism—may be reluctant to place trust in fellow politicians, resulting in decisions that prioritize national interests and capital over international cooperation.

The public goods game

The second game, the *public goods game*, involves several players deciding on an amount of money to allocate towards a public good. This money is then multiplied and given to other players of the game. What this game aims to analyze is the individual players' temptations to withhold their wealth. According to a study conducted by Fehr & Gächter (2000), players tended to allocate around 40% to 60% of their money. This might show up in politics; when politicians must decide to allocate resources to public goods, such as healthcare or welfare. In this scenario, politicians decide on how to balance national resources between public investments and private interests, reflecting the strategic considerations present in the public goods game.

According to extant work using the public goods game, agreeableness significantly predicts money allocated to public goods. In a study involving 72 students conducted three times over the course of five months, researchers found that agreeableness strongly correlated with cooperative behaviors (Volk et al., 2011). Inversely, participants who scored lower on agreeableness were found to exhibit less cooperative behaviors, resulting in more money kept to themselves. These findings may translate to politicians in that high agreeableness may predict investment in public goods.

The trust game

The *trust game* involves two players where one (the investor) is given a sum of money and has to decide how much they want to invest in the other player (the trustee). The money given to the trustee is multiplied, and the total sum is distributed between the investor and the trustee based on the latter's discretion. Studies of this game indicated that investors tend to send half of their initial endowment to the trustees while the trustees generally return only a third of the joint returns (Johnson & Mislin, 2011). Much like investors, political leaders must decide how much trust they invest in certain policies or international partnerships, hoping that these investments will yield returns. However, much like the game, there is a risk that these investments may not be reciprocated, potentially placing politicians in a vulnerable position that could be exploited, highlighting the dilemma they must face.

According to studies, the Big Five traits have had relevant impacts on this economic game. With a sample of 138 subjects, Müller and Schwieren (2012) found that agreeableness had a significant positive impact on the amount of money sent by investors. Further, they found neuroticism and conscientiousness to be inversely associated with money sent by investors. Interestingly, neuroticism and conscientiousness were not found to be correlated in their sample. Reinforcing these findings, another study with 90 participants found that higher scores in agreeableness correlated to higher amounts of money being sent (Evan & Revelle, 2008). These findings suggest that those who are more agreeable tend to trust others and engage in cooperative behavior in the trust game despite the risks involved. In contrast, individuals with higher levels of neuroticism or conscientiousness may be more mindful of risks, causing a reluctance of being cooperative.

In a political scenario, this could suggest that politicians who are higher in agreeableness tend to be more cooperative with others, invest greater amounts of resources, and trust that fellow politicians or other individuals will reciprocate with similar yields. Inversely, politicians higher on conscientiousness or neuroticism may tend to refrain from cooperative behaviors, taking a more cautious and conservative approach that minimizes the risks involved.

The outcomes of these economic games, as demonstrated by various experimental studies, provide valuable insights into the decision-making patterns of participants. With players forced to choose between cooperation and defection without knowing each other's intentions, these games mirror real-world scenarios where individuals must navigate uncertainty—a challenge political leaders frequently face in their decision-making processes. By applying the Big Five Personality Model, we can gain deeper insight into how personality traits influence these outcomes, shedding light on how leaders' personalities shape their political decisions and strategies.

The biology behind politics

Personality traits are not the only factors contributing to an individual's decision-making tendencies. The biological underpinnings of decision-making are equally critical in shaping how politicians respond to complex scenarios. Understanding these foundational neurobiological

processes behind political decision-making can provoke further advancements in understanding why politicians do what they do, accompanying the psychological traits previously discussed.

Genetic markers and the big five

At the forefront of these biological foundations are genetic markers, which subtly but significantly influence various personality traits and behavioral tendencies relevant to political leadership. Genetics plays a key role in shaping personality, namely the Big Five personality traits that influence political behavior. While a combination of genes and environment molds these traits, certain variations and predispositions contribute to variations of each trait, affecting political behavior at the fundamental level. Understanding the genetic underpinnings of these personality traits can offer insight into motivated behaviors.

CHRM2. The CHRM2 gene, encoding the M2 cholinergic receptor, which is involved in the cholinergic system, has been shown to relate to the traits of extraversion and conscientiousness (Luo et al., 2007). Based on his study with 554 participants, Luo found that interactions between CHRM2 haplotypes—sets of closely linked genetic markers or DNA variations on a chromosome that are inherited together—predict agreeableness. Specifically, individuals who carried the haplotypes of TCAAAT and CTCGAT were found to exhibit agreeableness more often. Interestingly, the authors found varying results based on the participant's health status, noticing that individuals diagnosed with certain conditions had a greater association between the CTCGAT haplotype and agreeableness. In contrast, individuals who were considered healthy had a lower agreeableness correlation. Similar to agreeableness, conscientiousness is also significantly related to variation in the CHRM2 gene. The authors found that the CTCCAA and CTGTT haplotypes showed a significantly negative relation with conscientiousness scores. Interestingly, they also noticed that the interaction between the two haplotypes was also associated with lower scores on conscientiousness. Based on our understanding of the behaviors associated with agreeableness and conscientiousness, it may be the case that politicians with the TCAAAT and CTCGAT haplotypes tend to follow social norms and conservatism, while those with CTCCAA and CTGTT share a proclivity to reject social norms and be more liberal.

Interleukin-6 (IL-6). Interleukin-6 is an inflammatory cytokine that promotes inflammatory responses in response to infections or injuries. Sutin et al. (2009) found IL-6 positively correlated with neuroticism and was inversely associated with conscientiousness in a large sample of 4923 individuals. Openness and agreeableness were also positively correlated with higher levels of IL-6, albeit with small coefficients of determination (all r^2 s < 0.001). No association was noted between IL-6 levels and extraversion.

Dopamine, the big five, and politics

Dopamine regulates memory, mood, and motivation and activates in response to a sense of accomplishment (Aboiron, 2022). While little is known about how dopaminergic systems influence politicians' decisions directly, extant work suggests that dopamine may act as a catalyst when performing goal-oriented tasks (Kurtulmus et al., 2018). When a politician sets and achieves a goal—whether winning an election, reaching favorable terms in negotiations, or securing victory in a conflict—dopamine is released, providing a sense of satisfaction linked to the accomplishment. Based on major theories in translational neuroscience, dopamine may improve motivation, reward perception, and overall leader effectiveness on path-oriented tasks (Alexander, Mathie, & Peters, 2006; Kurtulmus et al., 2018; Wise, 2004). However, this reward-driven system can have downsides; elevated dopamine levels and the frequent pursuit of this 'reward' can lead to an over-reliance on the pleasure of success, leading to an excessive focus on achievement and potentially becoming negligent on other factors (Aboiron, 2022).

Interestingly, some work has suggested that dopamine functions may correspond to some of the Big Five Personality Traits. According to MRI studies, the trait extraversion was found to be associated with greater activation in brain areas like the ventromedial prefrontal cortex, characterized by coding the value of rewards (Civai et al., 2016; DeYoung et al., 2010; Cremers et al., 2011). Though the association in these studies was weak and thus inconclusive, it suggests a relationship between extraversion and dopamine through its influence on reward sensitivity and motivational drive. Openness, a trait characterized by intellectual curiosity, aligns with some characteristics associated with dopamine. Studies show that dopamine is associated with novelty seeking through promoting exploratory behavior (Costa et al., 2014), conceptually linking the two and suggesting a relationship between them (DeYoung, 2013). The same case applies to conscientiousness, which is associated with the characteristics of striving for achievement. This aligns with dopamine's role in regulating motivation, suggesting a relationship between the two, though further study is needed (Kurtulmus et al., 2018). Although no empirical studies specifically on politicians exist, it may be the case that politicians who release dopamine more frequently may exhibit traits such as heightened extraversion, openness, and conscientiousness, as well as the political behaviors associated with them. Investigation of the precise impact of dopamine on personality traits and political decision-making should make a significant contribution to the political neuroeconomic literature.

The role of hormones in the political world

Testosterone and cortisol also play a pivotal role in decision-making by managing stress responses, social dominance, and risk-taking behavior (Mehta, 2015). Literature on hormones often associates testosterone with social dominance—or behaviors associated with gaining high status in social contexts—and aggressive behaviors (Mazur & Booth, 1998; Rowe et al., 2004). Cortisol, commonly referred to as the 'stress hormone,' regulates the body's response to stress by managing basal processes, blood pressure, and inflammatory and immune responses.

The dual-hormone hypothesis

While evidence of influence attributed to cortisol and testosterone as independent mechanisms of change is weak, researchers have found that the interaction between these two hormones predicts various behaviors (*dual-hormone hypothesis*; Mehta, 2015). According to the theory, higher concentrations of testosterone combined with lower concentrations of cortisol are predicted to be positively related to status-seeking behaviors. Inversely, lower concentrations of testosterone coupled with higher concentrations of cortisol are predicted to be negatively associated with status-seeking behaviors (Mehta, 2015).

Multiple empirical studies support this dynamic, showing that the interaction between cortisol and testosterone predicted aggressiveness, status-seeking, and dominance. For example, Popma et al. (2007), in a sample of 103 adolescents, aggressive and risk-taking behaviors were predicted by a negative interaction between cortisol and testosterone. Similarly, Mehta and Josephs (2010) found a significantly positive relation to dominant leadership when testosterone was high and cortisol was low, further reinforcing the role of two hormones' interactions in regulating aggressive behavior. Additionally, they found that dominance scores were marginally higher in men than women in their sample of 94 participants (50% male).

The dual-hormone hypothesis may be applicable to the political arena and open ways to predict political behaviors and decision-making. Based on this theory, new research may test whether politicians with higher testosterone levels but lower cortisol levels tend to be more aggressive and status-achieving. These genetic profiles may influence and play a role in foreign policy decisions, leaning toward riskier or more assertive strategies in negotiations or international conflicts. They may also lead to a proclivity towards dominance, which in turn could produce [at best] strong global leadership or [at worst] dictator-like tendencies.

On the other hand, politicians with lower testosterone levels and higher cortisol levels might exhibit more risk-averse and cautious behaviors. These politicians may prefer negotiation over aggressive postures, focusing on stability over pursuing dominance. When making decisions, they may tend to weigh losses and benefits more carefully than their testosterone-dominant counterparts, further contributing to more risk-averse behaviors. Indeed, there is a field waiting to emerge in politician neuroendocrinology that will provide important insights into how our leaders will govern.

Future directions

State of the field

The neuroendocrine and biological underpinnings of political behavior is an emergent but increasingly critical field that attempts to bridge the gap between biological sciences and political psychology. While traditional political science has a large focus on sociopolitical factors, recent advancements in neurobiology and endocrinology show how decision-making processes, personality traits, and biology may influence how politicians act, providing a new mode of exploration that may offer deeper insight into understanding the political world. Studies have shown that specific personality traits, namely the Big Five, are frequently observed in

politicians and are influenced by genetic factors. These traits are often associated with specific behaviors, such as being more risk-taking or risk-averse, affecting politicians' decisions. Furthermore, hormones such as testosterone and cortisol play significant roles in behaviors that are associated with social dominance, an essential trait in political leaders who regularly face high-stakes decisions. However, while these findings provide a foundation for understanding politicians' behavior on a biological level, much remains unexplored due to a relatively niche approach to the topic.

Gaps in research

Despite promising developments, our understanding of the influence of neuroendocrine and biological factors has noticeable gaps. While studies have linked genetic markers and variations to specific personality traits (e.g., IL-6 and neuroticism), the interaction between these two variables and high-stress environments that politicians experience remains largely unexplored. Additionally, while economic games serve as a useful tool in predicting decision-making under controlled contexts, they often have weak ecological validity and lack real-world complexity, especially in the realm of politics. Given these limitations, the application of economic games in determining political outcomes remains questionable but worthy of further exploration. Studies regarding the relationship between the Big Five personality traits and dopamine can also be improved on as associations in these studies were found to be weak, warranting the need for larger sample sizes, improved assays, and further computational advancements to substantiate the connections implied. Lastly, the direct study of genes and their variations in politicians may clarify the mechanistic underpinnings of how they make decisions.

Conclusion

In sum, studying the psychological and biological underpinnings of political leadership may provide an entirely new lens for understanding politician behavior and their decisions. While studies have linked political decision-making to personality types, genetics, and hormones, direct investigations involving politicians themselves are rare. Expanding research in this area could offer predictive insights into political behavior, potentially enhancing our capacity to anticipate leaders' responses in complex scenarios. Ultimately, advancing this interdisciplinary field will help unveil the biological roots and underpinnings of political decision-making, potentially transforming our understanding of the political world.

Precision Nutrition Approaches with Mediterranean, Ketogenic, DASH, and MIND Diets for Alzheimer's Disease By Gabriella S. Ip¹ and Jhah Cook²

¹Saint Francis High School, Mountain View, California, 94040

²Interdepartmental Neuroscience Program, School of Medicine, Yale University

Abstract

Alzheimer's Disease is a progressive neurodegenerative disease that severely impacts cognitive function and memory. Memory, the primary reason why individuals can function independently, is progressively diminishing in performance. Both long- and short-term memories take a toll on not only the individuals' lives but the lives of their loved ones. While there is currently no cure for Alzheimer's Disease, there are interventions available that can potentially slow its progression and reduce the risk of its development. One intervention gaining increasing attention in research is dietary modification. This review seeks to explore the effectiveness and components of various well-known diets, including the Mediterranean and Ketogenic diets, in relation to Alzheimer's Disease. The primary objective of this paper is to conduct a comprehensive investigation into the complex relationship between diet and Alzheimer's Disease. There were noteworthy findings that underscore the potential significance of dietary choices in managing AD. Both the Mediterranean and ketogenic diets exhibit promising associations related to the potential to mitigate AD-related cognitive decline. These diets, rich in antioxidants, healthy fats, and specific nutrients, appear to influence inflammatory pathways and neural health. This suggests their potential to support overall brain function and potentially delay the progression of the disease. Such findings underscore the importance of considering dietary factors in the holistic approach to Alzheimer's Disease management.

I. INTRODUCTION

Dementia presents an escalating global health concern, currently affecting more than 50 million people worldwide. The number is projected to rise to nearly 82 million in 2030 and 152 in 2050.¹ Dementia encompasses a range of neurological disorders; the most known group among them are the neurodegenerative diseases. Neurodegenerative diseases are characterized by a progressive deterioration of brain structure and function. The most common type of dementia and known neurodegenerative disease is Alzheimer's Disease (AD). AD affects cognitive function by worsening patients' memory and ability to function independently.² Currently, there is limited research on AD as the etiology of the disease is still not fully understood nor there is a cure. However, by investigating the potential influences of various diets, researchers will potentially be able to shed light on new avenues for understanding and managing this complex condition. Moreover, there is a growing body of research focused on strategies and lifestyle modifications that could potentially aid in preventing and combating AD. Numerous studies have delved into a range of diets, including the Mediterranean, Ketogenic, Diet Approaches to Stop Hypertension (DASH), Mediterranean-DASH Intervention for

Neurodegenerative Delay (MIND), and Western diets, to explore their potential effects on Alzheimer's disease pathology.

The Mediterranean diet is characterized by a selection of foods influenced by the culinary traditions surrounding the Mediterranean Sea, predominantly consisting of plant-based and minimally processed options. Fundamental components of this diet encompass whole grains, vegetables, legumes, seeds, olive oil, nuts, and fruits. In contrast, the ketogenic diet is defined by its low carbohydrate content and elevated intake of healthful fats. The dietary inclusions are nuts, olive oil, and avocado. The DASH diet underscores the consumption of whole grains, fruits, and vegetables. It also focuses on limiting saturated and trans fats as well as processed foods. The MIND diet combines both the Mediterranean and DASH diets. It encourages a plant-based plan with numerous vegetables, berries, whole grains, and nuts, and incorporates processed foods.^{3,4} Research has suggested that these diets may modulate the progression of AD. Precision nutrition, a plan that is unique to every individual's health, has garnered AD caregivers' and researchers' attention. This is due to the multiple lifestyle components of neurodegenerative diseases: clinical history, food preferences, and habits.⁵ The primary emphasis of this literature review is to explore the correlation between dietary patterns and their consequential effects on AD.

II. RESULTS

What is Alzheimer's Disease?

Alzheimer's Disease is a commonly known neurodegenerative disorder characterized by the accumulation of amyloid-beta peptides and neurofibrillary tau tangles in the brain. This leads to a gradual loss of neurons, impacting a patient's memory.⁶ The mechanism by which amyloid plaques and tau tangles lead to the gradual loss of neurons involves their accumulation disrupting essential cellular processes. Amyloid plaques, primarily composed of beta-amyloid protein fragments, can aggregate, and interfere with neuron-to-neuron communication, contributing to synaptic dysfunction and eventual neuronal death. Tau tangles, on the other hand, disrupt the internal transport system of neurons, leading to their degeneration over time. These accumulations collectively contribute to the progressive neurodegeneration observed in AD.⁶ These pathological developments underpin the gradual loss of neurons, culminating in a noticeable impact on a patient's memory faculties. As the disease unfolds, the symptoms of Alzheimer's intensify. Initial signs, including minor lapses in general recall, evolve into forgetting pivotal life memories. This physical and cognitive deterioration is what leads individuals with AD to lose their independence.^{6,7}

Cognitive Dysfunction and Memory in Alzheimer's Disease

Memory loss stands as the central hallmark of AD memory deterioration, frequently the earliest sign of the disease, affecting both working memory and long-term memory. This is often among the initial symptoms reported by individuals with AD. Memory loss profoundly alters

patients' lives, leading them to progressively forget events or tasks. From interfering mechanisms at molecular levels to neural networks, AD presents a complex pathology.

Memory is a vital cognitive function that includes encoding, storing, and retrieving information about stimuli. This significance arises from its comprehensive role in encapsulating accumulated knowledge and learned experiences. When the symptoms related to memory are first reported by patients, they consist of problems with episodic memory, speech production, naming or semantic problems, or visual orientation. There are two types of memory: short-term and long-term memory; these are also considered implicit versus declarative memory, respectively. Short-term memory holds limited amounts of information for a few seconds to a minute, functioning as working memory. This is what allows individuals to complete daily tasks like talking and walking since the information is available for immediate use. On the other hand, long-term memory is the brain's system for encoding, storing, and retrieving information for longer durations. Everything that individuals learn or develop over their lifetime is through long-term memory.⁶ Neurodegeneration in AD impacts both long-term and short-term memory. Semantic memory is first impacted in AD patients, which affects verbal fluency and naming. This is why AD patients can eventually forget how to read or forget significant life events like childhood memories.⁶

In addition, as the disease develops, AD patients lose independence of their body, which becomes a defining characteristic of the condition. This means that patients' skills in everyday life diminish, encompassing a range of tasks including activities like writing checks, eating, and essential procedures such as using the toilet. Additionally, there are behavioral changes in one's mood which can lead to frequent agitation.⁷ Such agitated mental states may lead to increased restlessness, verbal outbursts, and even physical displays of frustration. These behavioral alterations can significantly impact both the individual with AD and their caregivers, highlighting the multifaceted nature of the disease's effects.

Physiology of Alzheimer's Disease

The pathological hallmark of AD is the accumulation of amyloid beta peptides and tau tangles, two abnormalities that compromise cognitive function and memory retention. Amyloid beta peptides are protein fragments that, in a healthy brain, are broken down and eliminated. In AD, however, these fragments cluster and form plaque deposits between neurons.⁷ These plaques impact neuronal function in a negative way. This is mainly because the plaques obstruct neurotransmitter movement, leading to signaling problems between neurons. The communication between neurons also interferes with the inflammation and cellular damage due to the accumulation in forming these plaques. In addition, tau tangles are twisted strands of proteins that form within brain cells. Tau tangles are abnormal accumulations of a protein called tau within neurons, and their presence can disrupt the normal functioning of these brain cells. Specifically, tau tangles can impair the transport system within neurons. Neurons have long, branch-like structures called axons, which transmit information to other neurons. Tau helps stabilize these axonal structures. When tau becomes tangled, it can't perform this role effectively.

This disruption can lead to communication problems between neurons, hindering their ability to transmit signals and ultimately contributing to the cognitive and functional decline observed in conditions like Alzheimer's disease.^{6,7} They play a key role in maintaining the stability of microtubules in neurons. However, in AD, these proteins disassemble and form tangles that soon accumulate and clog the neuron. The abnormal buildup of both amyloid plaques and tau tangles disrupts neuronal communication and interferes with nutrient transportation which can lead to neuron death, and these create an immense impact on memory capabilities.^{7,8}

In addition to the amyloid beta peptides and tau tangles, there is a unique genetic risk factor for Alzheimer's: the APOE4 allele. Possessing a single copy of the APOE4 gene amplifies the risk of AD development by threefold compared to individuals lacking this specific gene. The APOE4 allele, a genetic variant transmitted across generations, is inherited as one allele from each parent, totaling two alleles. There are three variants of APOE: APOE2, APOE3, and APOE4 all differ by the position of their amino acids. All of the protein variants have the role of carrying cholesterol and other fats in the bloodstream. However, APOE alleles can also play a role in aging-associated diseases due to their metabolic impact during aging. Thus, APOE4 especially, impacts Alzheimer's patients through its effect on the brain's processing of amyloid beta plaques. Instead of the usual amyloid beta levels, the allele increases the production of amyloid beta which creates wider disruption in the brain.^{6,9} APOE4 carriers have been reported to perform worse in episodic memory tests and show smaller left hippocampal volumes, which underscores the condition of AD.⁶

While genetic factors like the APOE4 allele increase the risk of AD, there is also a risk within the role of gut microbiota. The gut microbiota impacts the brain's physiological, behavioral, and cognitive functions.⁵ The gut microbiome comprises a diverse community of microorganisms, primarily bacteria residing in the digestive tract. There is a delicate balance that exists in the gut microbiome between the different microorganisms, which means when there are interruptions by internal or external factors, it can lead to disorders or diseases. Such imbalances in the gut are seen in AD and other neurodegenerative diseases like Parkinson's. This imbalance consists of a decreased fecal microbial diversity, a lower abundance of beneficial bacteria, and a higher abundance of pathogenic microbes (microorganisms like bacteria and viruses that cause diseases).

FIGURE 1: THIS FIGURE ILLUSTRATES THE PATHOPHYSIOLOGY AND PROGRESSION OF AD, WHILE ALSO HIGHLIGHTING THE POTENTIAL INFLUENCE OF BOTH ALTERABLE AND UNALTERABLE RISK FACTORS THROUGHOUT THE VARIOUS STAGES OF THE DISEASE. THESE FACTORS SPAN THE LIFESPAN FROM PRECLINICAL TO ITS ADVANCED STAGES.¹⁰

There is a two-way communication system between the gut microbiome and the brain called the “gut-brain axis”-playing a role in neuronal development, brain function, cognitive regulation, and aging which are all related to AD.¹¹ With this information exchange network, the gut microbiota provide essential nutrients for the body and produce neurotransmitters. It communicates with other organs and the brain, facilitating a complex interplay. This interaction, whether indirect or not, holds the potential for these neurotransmitters to influence neuronal activity and cognitive functions within the brain. Thus, potentially leading to an imbalance that leads to disorders such as AD.⁵ Furthermore, an imbalance in gut microbiota is associated with a heightened risk of AD. Conversely, a healthy gut plays a crucial role in preventing inflammation triggered by bacteria or toxins. This is an immune system response—resulting in neuroinflammation and contributes to neuronal damage and cognitive decline. Therefore, it is important to keep a healthy lifestyle by eating a healthy diet. There is emerging research on the possibility of different diets benefiting AD patients.

Diet and Management/Progression of Alzheimer’s Disease

Components of lifestyle, especially diet, have been frequently researched and found to be promising alternatives for improving nervous system-related disorders. Aside from traditional therapies, food intake, diet changes, and nutritional supplements can serve as an alternative support; this is primarily due to the role of diet on neurotransmitter levels.^{5,12} Since there is currently no cure for AD, this nutritional balance in diet can play a role in managing symptoms and limiting progression. The enriched diets containing different nutrient-abundant compounds can be met with organic foods, which provide benefits for AD. Organic foods contain more mineral compounds: iron, magnesium, phosphorus, and potassium than conventional foods.

These diets include the Mediterranean, ketogenic, DASH, and MIND diets. Researchers have linked Alzheimer's disease to elevated levels of deficiencies in multiple areas that lead to damage; one way to repair those imbalances would be through food.¹³

Within the scope of a ketogenic diet, a case was carried out on a patient with mild AD who also possessed the APOE4 allele.¹⁴ A 71-year-old female with the APOE4 allele was given a diagnosis of mild AD with a family history of the disease. The APOE4 allele, a genetic variant that increases the risk of AD, is passed down through generations. The risk is increased due to the allele increasing the production of amyloid beta plaques that should be managed and consistent. This increase in production is what contributes to the accumulation and eventually weakens the brain's memory performance.⁶ The woman in the study was under a 10-week intervention that involved daily cognitive training, low-impact exercises 3 days per week for 30 minutes, and a nutritional ketogenic diet. For daily cognitive training, the patient used a brain training application on her mobile device; the training helped measure language, problem solving, mental agility, memory, and focus designed to strengthen the brain's cortexes and parts. During low-impact exercises, the patient used light dumbbells. Measurements such as the blood ketone levels were also measured weekly via the lab's blood ketone meter; other aspects such as glucose levels and biomarkers were also closely supervised by the researchers. Before the case study, the patient had impaired cognition in forgetfulness and delays. However, the 10-week intervention resulted in a positive correlation between lower insulin levels, lower triglyceride levels, glucose levels and HgA1c levels. Insulin plays a role in regulating glucose metabolism in the brain, and disruptions can lead to brain cell dysfunction, oxidative stress, and inflammation. Triglyceride levels that are elevated can lead to inflammation. Regarding glucose, the brain relies heavily on glucose for energy, but if the levels are elevated, this can result in insulin resistance which can cause cells to become less responsive to insulin. Higher HgA1 levels relate to oxidative stress and inflammation. Results show that the implementation of a ketogenic diet with the purpose of restoring metabolic flexibility, low-impact exercises, and daily cognitive training, can mediate the risk of the APOE4 allele in a mild AD patient. The woman in the case study had a family history of AD that suggested a rapid progression of the disease, but the intervention she underwent increased systemic health and prevented further progression of AD.¹⁴

Dietary patterns and nutritional supplements from past studies have shown how these can benefit APOE4 carriers and AD patients, since they focus on precision nutrition. Norwitz et al. 2021 alludes to precision nutrition involving tailoring dietary interventions to specific metabolic characteristics of an individual, which can help with AD patients. Precision nutrition not only contributes to overall health and well-being but also enables patients to access the specific nutrients required to support their brain health.¹⁵ Nutrition for AD patients can focus on preventing insulin resistance which can help to prevent competition of amyloid beta plaque degradation by insulin. A low-carbohydrate diet can help optimize cerebral blood flow and therefore reduce AD risk. Since different bioactive compounds from food produce effects on NDD, diets create a big impact on the body.

Figure 2 DEPICTED HERE ARE PROSPECTIVE PATHWAYS THAT LINK DIET TO ALZHEIMER'S DISEASE(AD). AGE-RELATED PROCESSES DISPLAYED WITH THE YELLOW ARROW MAY CAUSE THE DEPOSITION OF AMYLOID BETA, A MAIN CHARACTERISTIC OF AD PATHOGENESIS. DIETARYFACTORS SHOWN IN THE WHITE BOX MODULATE THE RISK OF AD THROUGH THEIR ACTIONS MENTIONED PREVIOUSLY. APOLIPOPROTEIN E(APOE) 4 IS A GENETIC RISK FACTOR THAT CONTRIBUTES TO THE AD PATHOGENESIS

Mediterranean Diet

The Mediterranean diet features foods inspired by the cuisines around the Mediterranean Sea, which includes plant-based and unprocessed foods. This diet is characterized by whole grains, vegetables, beans, seeds, olive oil, nuts, and fruits. It also includes a moderate to high intake of fish and other kinds of seafood, while having a low to moderate intake of dairy products. This diet does allow for a low intake of non-fish meat and meat products, as well as moderate consumption of wine.^{3,4} The Mediterranean diet has been associated with low rates of AD and improved disease progression, due to the high amounts of antioxidants and anti-inflammatory compounds. Through the richness of Omega-3 fatty acids from fish, the Mediterranean diet decreases inflammation in the brain. Omega-3 fatty acids sourced from fish particularly docosahexaenoic acid (DHA) and EPA possess anti-inflammatory properties that reduce inflammation. These fatty acids are incorporated into cell membranes and can enhance fluidity and stability. The fruits, vegetables, and whole grains in this diet are also abundant in antioxidants which protect the brain from the effects of oxidation. Oxidation originates from oxidative stress—a result of harmful particles called free radicals building up in the body and causing damage to the cells. The body can usually handle these limited instances, but sometimes the body cannot keep up with the neutralization process so oxidative stress occurs.^{5,15} Hence, from all the components in the Mediterranean diet, lower risks and rates of AD are decreased. This diet has also been recognized to lower levels of other health concerns like heart disease and certain cancers.¹⁵

Ketogenic Diet

The ketogenic diet is characterized by a low-carbohydrate and high-fat diet. Some of the foods include nuts, olive oil, avocado, butter, and high-fat cheeses, which are all fat sources. The proteins in the diet are derived from meats like beef, chicken, turkey, fish, or seafood. The carbohydrates that are included come from leafy greens, broccoli, and zucchini. Dairy products include cream, cheese, and unsweetened yogurt. The goal of the diet is to get the body into a

metabolic state called ketosis, allowing your body to use stored fat.^{3,4,14} This same stored fat is eventually converted into energy for the brain which can improve the disruption of glucose metabolism from AD. Additionally, there is a neuroprotective effect in which high levels of ketones have the potential to reduce amyloid-beta plaques and tau tangle accumulation, improving brain network stability. Ketones may also reduce oxidative stress and inflammation through the selection of foods for this diet. Antioxidant defenses can be boosted and therefore lower inflammation and AD progression as well.¹⁵

DASH (Diet Approaches to Stop Hypertension) Diet

The Diet Approaches to Stop Hypertension Diet, most known as the DASH diet, focuses on limiting saturated, trans fats, and processed foods. It emphasizes the intake of a variety of high nutrient foods that help lower blood pressure such as potassium, calcium, and magnesium. Foods in this diet include whole grains, fruits, and vegetables. There are also certain elements of lean proteins, dairy, and fats and oils. The DASH diet encourages 4-5 servings of fruits and vegetables daily and 6-8 servings of whole grains that are higher in fiber. Lean proteins like lean meats, fish and low-fat dairy that are high in calcium are also a part of the diet plan. The DASH diet emphasizes portion size, eating a variety of foods, and getting the right amount of nutrients instead of focusing on specific restrictions. This makes it a versatile diet that can be adapted to any patient, including those with AD.^{3,4} Since this diet encompasses a variety of healthy foods that are linked to positive effects on brain health, the DASH diet can help slow cognitive decline and can help minimize the risk of developing AD. The fruits and vegetables are rich in antioxidants, impeding neurological damage; the whole grains and lean proteins contain a high amount of essential vitamins like Vitamin B, which boosts brain health.

MIND (Mediterranean-DASH Intervention for Neurodegenerative Delay) Diet

The MIND diet is a combination of the Mediterranean and DASH diets. It blends both diets to create a food plan geared towards brain health, encouraging a plant-based plan with numerous leafy green vegetables, berries, whole grains, nuts, olive oil, fish, beans, poultry, and processed foods. This diet also focuses on limiting the intake of unhealthy foods like butter, cheese, red meat, fried foods, and sweets. This diet emphasizes balancing a high-nutrient and brain-boosting plan along with a good lifestyle.^{3,4} The diet is rich in antioxidants from fruits, and vegetables, omega-3 fatty acids from fish, and Vitamin E from nuts, all of which protect the brain and slow cognitive decline. Since there is a limitation on foods that are high in saturated fats and sugar, the MIND diet can reduce the amount of inflammation in the brain for AD patients.

	The Mediterranean Diet	DASH Diet	MIND Diet
Major aspect	The plant-based diet consists of minimally processed products based on the traditional diet of individuals living in the Mediterranean region.	The plant-based diet consists of all minimally processed products used for cardiometabolic conditions especially reduced hypertension. It focuses on reducing the intake of saturated fatty acids, trans fats, and sodium in the diet.	It is a combination of the Mediterranean diet and the DASH diet. It strictly defines the types of ten recommended and five contraindicated products. The plant-based diet consists of all minimally processed products used to improve brain cognition and reduce the risk of certain age-related neurodegenerative diseases.
Recommended	• vegetables, • fruits • nuts • legumes • whole grains • extra virgin olive oil olives • fish and seafood • moderate consumption of fermented dairy • red wine in limited quantities * portions are not exactly specified	• vegetables • fruits • nuts • legumes • whole grain products • low-fat dairy products * portions are not exactly specified	• green leafy vegetables (≥ 6 p/week) • other vegetables (≥ 1 p/div.) • nuts (≥ 5 p/week) • berries (≥ 2 p/week) • pods (≥ 3 p/week) • whole grains (≥ 3 p/div.) • poultry (≥ 2 p/week) • fish and seafood (≥ 1 p/week) • olive oil (basic oil) • wine (1 p/div.)
Contraindicated	• red meat • sweets and sugars	• total fat intake • red meat • salt and sodium-rich products • sweets and sugars	• red meat (<4 p/week) • butter and margarine (<1 tbsp/div.) • cheese (<1 p/week) • cakes and sweets (<5 p/week) • fried and fast-food products (<1 p/week)

FIGURE 3: A TABLE COMPARING THE MEDITERRANEAN, DASH, AND MIND DIETS IN THREE CATEGORIES: MAJOR ASPECT, RECOMMENDED AND CONTRAINDICATED FOOD PRODUCTS.⁴

Positive Dietary Factors	Negative Dietary Factors
Foods rich in antioxidative and anti-inflammatory compounds: • Vitamin E (e.g., cold pressed vegetable oils) • Vitamin C (e.g., citrus fruits, berries, acerola, peppers, broccoli) • B-vitamins (e.g., nuts, seeds, beans, whole grain product) • Polyunsaturated fatty acid (e.g., fish and seafood, nuts, camelina oil, linseed oil) • Polyphenols (e.g., grapes, berry fruit, green tee, red wine)	• Highly processed products- fast food, ready-to-eat meals • Saturated fatty acid (e.g., animal fats, palm oil, highly processed food) • Trans fatty acids (e.g., partially hydrogenated fats in foods, meat) • Simple sugar (e.g., sweets and sugar) • Poor quality food—risk of excess consumption of pollution and toxins, e.g., heavy metal

FIGURE 4: THE INFLUENCE OF POSITIVE AND NEGATIVE NUTRITIONAL FACTORS ON THE PREVENTION OF ALZHEIMER'S DISEASE.⁴

Diet and its Influence on Neurotransmitters

Gamma-aminobutyric acid

Gamma-aminobutyric acid (GABA) is an important inhibitory neurotransmitter that participates in various metabolic and physiological activities in the brain cortex. GABA is an amino acid synthesized in the brain, playing an essential role in communication between the brain cells. GABA also decreases the activity of the brain neurons, diminishes stress, stabilizes mood, decreases pain, and improves sleep; most importantly, they balance the average neuronal activity level.^{11,12} High contents of GABA are found in raw spinach, sweet potatoes, potatoes, mushrooms, chestnuts, and white tea. Ensuring essential fatty acids in GABA production, dried fruits, eggs, fish, and meat also favor the synthesis of this neurotransmitter. These foods include vitamin B and sugars that facilitate GABA production.¹² While GABA is not directly implicated as a cause of AD, its role in the disease's progression is being investigated. Dysfunction in GABA roles may contribute to cognitive decline. Specifically, the disruptions in the balance between excitatory and inhibitory neurotransmitters can impair neuronal communication, potentially affecting memory and cognitive functions.¹¹ Thus, incorporating foods that favor the synthesis of GABA could help ameliorate cognitive deficits associated with AD.

Dopamine

Dopamine is a neurotransmitter present in the midbrain, affecting several areas of the brain in a systematic manner that modulates thinking, feeling, and action. It also works as a neurochemical modulator that affects brain activity. Dopamine has multiple hubs in the brain, each controlling different functions like learning and prediction rewards. The secretion of dopamine in the bloodstream is extremely important; impairment can lead to confusion and a loss of concentration. High contents of dopamine are observed to be in velvet beans, meat, poultry, eggs, milk products, chocolate, fruits, vegetables, soy products, wheat, olive oil, and sesame and pumpkin seeds. Elevated dopamine levels help improve sleep, attention, mood, as well as memory—aspects involved with Alzheimer’s Disease.^{11,12} A daily intake of these foods can surge dopamine levels that promote deep thinking and memory.

Acetylcholine

Acetylcholine (ACh) is the main neurotransmitter in the brain and plays a role in improving attention, understanding, and memory. ACh cells are found in several places: the brainstem, midbrain, and nuclei collections like the septum and spread to any other area in the brain. It is very involved in cognitive processes such as concentration and learning. One of the leading causes of Alzheimer’s Disease is the deficiency of ACh in some regions of the brain, which is why there is a fluctuation in consciousness and disordered thinking. This is why it is necessary to raise ACh levels through foods such as dairy products, turkey, beef, green peas, salmon, soybeans, and lentils. The foods with the highest levels of ACh are oranges, strawberries, and reddish.^{11,12} Therefore incorporating these foods in AD patients’ diets can be especially helpful since the ACh levels impact the progression of AD.

Serotonin

Serotonin is the neurotransmitter that is referred to as the “happy molecule.”¹² It plays a role in mood regulation, appetite, social behavior, sleep, learning, and gastrointestinal mobility. Serotonin is what helps adjust the brain’s behavior with neurological, mental, biochemical, and metabolic processes for control; this encompasses wakefulness, sleep, appetite, aggression, body temperature, and neuroendocrine activity. Insufficient production of this neurotransmitter can result negatively in emotional disorders like depression. Low serotonin levels can be increased with kiwi, oranges, bacon, walnuts, turkey, fruits, vegetables, and seeds. These include beans, onion, peanuts, hot peppers, oats, and walnuts.^{11,12} Incorporating these foods can improve the symptoms and progression of AD with its involvement in cognitive functions.

Glutamate

Glutamate is one of the brain’s most plentiful amino acids, contributing to the activation of a cell when it attaches to a receptor site. A high level of glutamate can lead to the destruction of brain cells and overstimulation. However, when the levels are closely monitored, glutamate plays a role in synaptic plasticity which is important in the learning process. Glutamate can enhance synapses which increase the strength of signals transmitted throughout the body, improving

communication patterns of the brain and the processing of new information. It is mostly found in the central nervous system and found in high protein foods. Foods with glutamate include seafood, stews, sauces, seaweeds, cheeses, fish sauces, soy sauce, and tomatoes. There are also components like sodium, potassium, calcium, and magnesium that can enhance flavors while producing a source of this amino acid. Contrary to the neurotransmitters, meat and other animal products are the weakest sources of glutamate.^{11,12} Since glutamate is universal and found in most living organisms, it is important to include these foods in AD patients' diets as glutamate levels significantly impact learning process abilities and brain plasticity the most.

Norepinephrine

Norepinephrine, also called noradrenaline, is a catecholamine that functions like a hormone and neurotransmitter. It acts as a stress hormone, influencing the brain's attention and activities and has body-wide effects. These effects can be carried throughout the nervous system and bloodstream through the adrenal medulla. Norepinephrine has a role in wakefulness, memory, mental clarity, fight or flight response, as well as consciousness and alertness levels. It's the primary chemical influencing brain arousal, affecting how the brain deals with both physical and emotional stress. Foods that increase norepinephrine levels include dairy products, bananas, meats, fish, seafood, chocolate, and banana peels.^{11,12} With an elevated amount of norepinephrine in their diet, there can be improvements in cognitive ability which can allow patients to manage AD progression better.

Epinephrine

Epinephrine is an excitatory neurotransmitter that prepares the body for the fight or flight response, similar to norepinephrine. An increased level of epinephrine release can raise heart rate, blood pressure, glucose production, and highly stimulated emotions like fear or anger. As a response, the body's nervous and endocrine systems prepare for dangerous situations by increasing the nutrient supply to main body organs. Epinephrine specifically aids in communication between neurons. Since it also has functions other than inside the brain, it functions as a hormone, involving numerous functions. This neurotransmitter decreases airway swelling, and obstruction, improves blood circulation, restricts blood vessels, elevates heart rate, and increases blood flow throughout the body. Although there is limited research on the food types that raise epinephrine levels, foods like coffee, tea, citrus fruits, cocoa, and vanilla can increase levels. Epinephrine has been found to improve mood and cognitive performance by utilizing specific amino acids used during its synthesis, which makes it important for AD patients to have these foods included in their diets.^{11,12}

III. DISCUSSION

Drawing from the findings, this research indicates a profound and beneficial influence of specific diets on patients suffering from Alzheimer's disease. These diets, specifically the Mediterranean diet, Ketogenic diet, DASH, and MIND diet, are characterized by organic and

nutrient-rich food items. The essential components of these diets, particularly their richness in antioxidants, demonstrated the potential to mitigate inflammation in the brain, revealing a striking correlation between diet and the progression of Alzheimer's disease. The evidence discovered points towards certain food components, like those rich in these antioxidants and healthy fats, capable of triggering neurotransmitters that might impede the progression of Alzheimer's. Thereby reinforcing the significant relationship between dietary factors and the disease. Capable of triggering neurotransmitters that can decelerate the advancement of Alzheimer's, further reinforcing the relationship between dietary impact and the disease.

Nonetheless, there are areas within the study that presented limited correlations and exceptions; a prime example is the current understanding of Alzheimer's and its relationship with diet. The scarcity of studies examining this specific correlation sadly restricts the ability to draw more definitive conclusions. Despite these limitations, the strides made in this preliminary research may pave the way for further understanding and provide a hopeful future for Alzheimer's patients. This research presented some drawbacks or limitations, predominantly the limited knowledge of the disease itself and a comprehensive understanding of its pathology. However, the findings, despite these limitations, still support the original hypothesis of the beneficial impact of a well-balanced, nutrient-rich diet on the progression of Alzheimer's. This paves the way for future research in Alzheimer's Disease and highlights the significance of this area of discussion.

This research presented some drawbacks or limitations, predominantly the limited knowledge of the disease itself and a comprehensive understanding of its pathology as it relates to diet. For instance, there was variation in study methodologies as well as small sample sizes. Moreover, the long-term effects of specific diets on AD progression remain relatively unexplored, making it challenging to establish concrete cause-and-effect relationships. However, the findings, despite these limitations, still support the original hypothesis of a beneficial impact of a well-balanced, nutrient-rich diet on the progression of AD. It is crucial that in the future, there is more research done on the relationship between Alzheimer's Disease and diet, especially since during this literature review, there were limited studies that impacted the amount of synthesizing the connection.

Based on these findings, adopting the precision nutrition approach is ideal for managing AD patients. Personalizing this approach using the four diets can enhance health benefits. This approach is uniquely tailored to everyone; from considering their genetics, lifestyle, and gut microbiota, which can maximize the benefits from the diets on the progression of AD. Even with these significant findings, it is important to consider the current limitations in research concerning this relationship between diets and Alzheimer's disease. The field continues to grow along with the progress in fully understanding the complexities of Alzheimer's.

As Alzheimer's research continues to expand its interventions to help patients, emphasizing the potential benefits of various diets is essential. These diets encompass the Mediterranean, ketogenic, DASH, and MIND diets. This literature review is dedicated to exploring the correlation between dietary patterns and their impact on Alzheimer's disease. With

the intensification of Alzheimer's disease research, highlighting the potential benefits of diets, including the Mediterranean, DASH, and MIND diets, becomes crucial. The Mediterranean diet's anti-inflammatory properties, the DASH diet's antioxidant-rich components, and the MIND diet's cognitive decline mitigation collectively offer promising avenues.

A precision nutrition approach tailored to Alzheimer's disease (AD) patients, integrating these diets, emerges as a compelling strategy. Personalization, which takes into account genetics, lifestyle, and gut microbiota, can significantly amplify the impact of these diets on the progression of AD. However, it is important to acknowledge the current limitations in research as the field continues to evolve in understanding the intricate relationship between diet and the complexities of AD.

IV. METHODS

To ensure a comprehensive and informative exploration of the relationship between diet and Alzheimer's Disease, this literature review has adopted a rigorous methodology in sourcing pertinent academic articles. For the retrieval of these articles, primary databases such as PubMed and Google Scholar were used. The databases were searched with terms related to diet, Alzheimer's Disease, physiology, and neurotransmitters to identify relevant publications from 2004-2023. Moreover, these databases facilitated a nuanced investigation into specialized subjects, such as the impact of neurotransmitters on dietary influences and other physiological dimensions of Alzheimer's Disease. To ensure the significance of the findings, all references are precise and up to date.

V. ACKNOWLEDGEMENTS

This research was funded by Lumiere Education. I would like to thank Jhah Cook and the remote resources at Yale University for their help in constructing this research review paper.

VI. BIOGRAPHY

Gabriella is a senior in high school out in Northern California. On the academic front, she is interested in addressing public health issues and environmental health initiatives. In addition, she is interested in the biological mechanisms underlying neurodegenerative disorders. Gabriella had the opportunity to conduct research with Jhah Cook, a Ph.D. student, in the Psychiatry Department at the Yale School of Medicine, through the Lumiere Research Program. During this time, she sought to produce a comprehensive paper on the identification and treatment of Alzheimer's disease through dietary intervention. Her goal was to introduce alternative approaches for alleviating Alzheimer's disease and foster discussions between scientists and non-scientists alike

Black Holes and the Information Paradox By Oliver Ferber

Abstract

This paper delves into the intricacies of black holes and the hurdles they cause for physicists. Initially, the formation of black holes is discussed, followed by an in-depth analysis of what they are and how General Relativity has contributed to our understanding of black holes. The discussion then moves on to the influence of Quantum Mechanics on black holes and introduces the concept of Hawking Radiation. After that, the Information Paradox is introduced, followed by a discussion of the various opinions physicists have about it and analyzing in depth the position of physicist Leonardo Suskind. This paper then discusses what physicists think about the Information Paradox in contemporary times, and the broader implications of it for the General Relativity versus Quantum Mechanics debate in the scientific community.

Introduction

In order to understand black holes, it is important to understand where they come from. Most black holes emerge from the remnants of a large star that dies in a supernova explosion. Stars initially start as huge clouds of gas and dust, which eventually start growing in size due to a nuclear reaction in their core, starting the main sequence stage of their life. Eventually, the star will run out of the hydrogen that fuels the nuclear reaction and will usually start to shrink until it turns into a White Dwarf. However, if the star is much bigger, it will explode in a supernova explosion, leaving behind a very dense Neutron Star. If this Neutron Star is especially big or unstable, then the Neutron Star will start to collapse in on itself due to the sheer force of its gravity, squishing all of its mass into a smaller and smaller area, creating an object so dense that its gravitational force is so strong that not even light can escape from it. This new object is called a black hole¹.

What is a black hole?

A black hole is a celestial object so massive and concentrated that not even light (or anything traveling at the speed of light) can escape from it. This is significant because the speed of light is the fastest speed that can be achieved in the universe, as stipulated by Albert Einstein's theory of Special Relativity². Thus, up to a certain distance (the event horizon), nothing can escape the gravitational pull of a black hole.

The force of gravity is directly proportional to the mass of the black hole and inversely proportional to the volume of the black hole. In other words, a black hole gets its massive gravitational force by having as much matter as possible squished into as small a space as possible, meaning that an object with any mass can become a black hole if all of its matter is squished into a small enough volume. Karl Schwarzschild, a German physicist and astronomer, did some calculations and came up with the following equation, which determines the maximum radius possible of a black hole (the Schwarzschild Radius) based on its mass: $r = \frac{2GM}{c^2}$. In this equation, Schwarzschild sets the radius equal to the product of M, the mass of the object, G, the

universal gravitational constant, and 2, divided by the speed of light squared. This equation allows physicists to see just how densely packed an object must be for it to become a black hole. For example, our sun, a pretty average-sized star, has a mass of 1.9891×10^{30} kilograms and a radius of 6.96×10^5 kilometers. For our sun to become a black hole, it would have to be compacted into an object with a Schwarzschild Radius of 2.95 kilometers, a volume reduction of more than 10^{15} times its original volume. The Schwarzschild Radius of a human being would be about 10^{-25} meters, way smaller than the nucleus of an atom³. Thus, while a black hole does not necessarily have to be supermassive to stop light from escaping, it does have to be extraordinarily dense. Nevertheless, most black holes are massive. Stellar black holes (the smallest kind) range in mass between 3 and 10 times the mass of our sun (solar masses), intermediate mass black holes are estimated to have a mass between 100 and 1000 solar masses, and supermassive black holes have masses ranging from millions to billions of solar masses⁴.

Since black holes are extremely massive and dense, and hence have an extremely strong gravitational field, black holes do not remain static but rather are constantly collapsing in on themselves. While an object immediately becomes a black hole once its radius is less than or equal to its Schwarzschild Radius, the black hole will continue to decrease in volume, becoming even more dense, as its gravitational force causes it to collapse in on itself. Eventually, the black hole will have collapsed so deep on itself that all of its matter will be concentrated into a singularity: a single point with zero volume where all the matter of the black hole is concentrated⁵.

In order to understand the profound implications of all of the mass of a black hole being concentrated into a singularity, it is important to understand General Relativity⁶. In 1915, following his publication of the theory of Special Relativity, Einstein published a paper on General Relativity. General Relativity made a huge impact on the way physicists perceived the world. General Relativity made the claim that our universe is a four-dimensional field made of the three dimensions of space and one dimension of time (rather than just the three dimensions of space). This field of spacetime that makes up our universe can be likened to a trampoline. Just like a trampoline, spacetime is not flat but rather can be curved when massive objects are present within. This can be likened to placing a bowling ball on top of the netting of a trampoline, causing the netting to curve around it. Under General Relativity, gravity is the force that results from the curvature of spacetime, drawing objects that travel through spacetime to a massive object due to the result of spacetime being curved around it. In the trampoline metaphor, this can be likened to a marble rolling towards the bowling ball and being drawn towards it due to the curvature of the trampoline. Now, the thing about the curvature of spacetime is that gravity does not just influence objects to change their movements in space, but it also influences the way time works around massive objects. General Relativity addresses the concept of spacetime, not just space. Thus, not only would the bowling ball force the marble to fall toward it, but it would also slow down time for the marble. The marble itself would not notice any difference, but an outside observer (say a raspberry at the edge of the trampoline is witnessing all of this) would notice that

time is slowing down for the marble, giving the illusion that the marble is taking forever to fall into the black hole.

Now, imagine increasing the mass of the bowling ball to something tantamount to the mass of Mount Everest, while, simultaneously, decreasing the volume of the bowling ball to the size of a lemon. This should help give an idea of what occurs when a black hole, with all its mass compressed into a singularity, exists in the universe. Anything within the vicinity of the black hole will fall into the singularity, further increasing the mass of the black hole (remember, not even the speed of light can escape the grasp of a black hole). The object falling into the black hole will rapidly increase its velocity as it falls towards it, likely approaching the speed of light⁷. However, to an outside observer (the raspberry) the object will appear to slow down (while in reality, it is time itself that is slowing down, not the object), taking forever to reach the singularity, appearing to reach a standstill. Meanwhile, the object falling towards the black hole will find outside observers moving at an impossibly fast rate (remember, it is just that time has slowed down for the object), moving, dying, and new ones taking their place all while the object falls toward the black hole. Other people's lives will literally flash before the object's eyes (assuming it could actually see them across the vast distance of space). Also, according to Einstein's theory of Special Relativity, as an object approaches the speed of light, time slows down for it. As the object accelerates, time will slow down even more for it, contributing to the time dilation effect experienced⁸.

Before delving into the intricacies of the Information Paradox, one more aspect of the black hole must be discussed: the event horizon. While black holes are extremely massive, dense, curve spacetime to the extreme, and have a gravitational pull so strong that not even light can escape from it, there is still a limit to the strength of a black hole⁹. Isaac Newton discovered that the gravitational attraction between two objects is inversely proportional to the distance between them. In other words, the farther apart objects are, the weaker the gravitational force. Thus, while black holes have a very strong gravitational force, as one moves away from the black hole, the gravitational force becomes weaker. There eventually will exist a distance from the singularity where objects moving at the speed of light will be able to escape the black hole. This boundary is called the event horizon. Inside the event horizon, light cannot escape, giving the impression that the black hole is black. Outside the event horizon, light can escape but due to the immense force of gravity usually ends up orbiting the black hole, producing the bright light that can often be seen surrounding a black hole¹⁰. The black hole's gravity is so strong that it causes faraway things to orbit it as well. For instance, most galaxies have a supermassive black hole at the center, causing all the solar systems within to orbit it. Our galaxy (The Milky Way), has a supermassive black hole at the center named Sagittarius A. This black hole has a mass of 4.3 million solar masses and is 26,000 light years away from Earth. Despite being so far away, its immense gravitational force keeps the whole Milky Way together and causes Earth and the rest of the solar system to orbit itself, completing a rotation once every 230 million Earth years¹¹.

Hawking Radiation¹²

While black holes may seem simple – giant celestial objects that suck any object in their vicinity into their grasp– there are a number of complexities with them. The complications regarding black holes arise because multiple different fields of physics are necessary to understand them, and these different fields often come up with contradictory results. Two of the most relevant fields to understanding our universe and black holes are General Relativity and Quantum Mechanics. General Relativity, as discussed earlier, is extremely useful when studying large objects in space and the gravitational effect they have on one another. Quantum Mechanics, on the other hand, is extremely useful at analyzing things smaller than an atom and how the other three forces in the universe (electromagnetism, strong nuclear force, and weak nuclear force) interact with one another. Usually, these two fields have nothing to do with one another because General Relativity handles the massive things and Quantum Mechanics handles the tiny things¹³. However, this is not the case with black holes. Black holes are massive and generate an immense gravitational field, making it crucial to use General Relativity when studying black holes. Black holes, however, are also very tiny with all their matter compressed into a singularity. This makes Quantum Mechanics relevant when studying black holes. Moreover, Quantum Mechanics is also very important with regard to what happens to matter as it falls into a black hole at the microscopic level. Thus, both fields are very important to be used when studying black holes. While a single unifying theory across both Quantum Mechanics and General Relativity is desired to explain the nature of the universe, in the absence of such a unifying theory, most physicists currently agree that Quantum Mechanics better explains black holes than General Relativity. The debate between the two theories will be explored in detail in the remaining sections.

Results

In early 1974, Stephen Hawking, one of the most brilliant theoretical physicists in modern times, was using Quantum Mechanics to study what happened to matter as it fell into a black hole. What he discovered was fascinating. Hawking discovered that black holes radiate particles outwards. To understand the profound implications of this finding, it is important to remember just how strong the gravitational force of a black hole is and how according to General Relativity, a black hole should cause a divot so deep in spacetime that nothing beyond the event horizon should be able to escape. Yet, despite all of this, Quantum Mechanics boldly states that a black hole should be radiating particles outward at a steady rate. Upon realizing the bold implications of his findings, Hawking admits to putting “quite a lot of effort into trying to get rid of this embarrassing effect”¹⁴. However, Hawking and other physicists eventually came to realize that this finding must be true based on other types of analysis of black holes and eventually came to accept that Quantum Mechanics was right and General Relativity was somewhat mistaken in this case¹⁵.

Hawking writes two different approaches to understanding how it is possible for a black hole to radiate particles. One approach utilizes Quantum Mechanics, which stipulates that space is filled with virtual particles (these particles are called virtual because they cannot be observed directly with a detector) and antiparticles (antiparticles are the same as particles except they have

an opposite charge) that are constantly “materializing in pairs, separating and then coming together again and annihilating each other”¹⁶. In this approach, Hawking stipulates that it is possible for the antiparticle to fall into the black hole while the particle somehow manages to escape. Since the particle’s antiparticle pair is gone in the black hole, the particle has no antiparticle to annihilate itself with and will proceed to escape to infinity, giving the illusion that it has been radiated out by the black hole. The second approach stipulates that instead of viewing the radiation as a particle that has separated from its antiparticle pair and has escaped to infinity, it should instead be viewed as a particle that has already been sucked into the black hole but is now traveling backward in time while simultaneously getting further away from the black hole until it has escaped from its grasp. When the particle has gone back in time enough that it has reached the point in time when it and its antiparticle pair materialized, the particle will become scattered from the gravitational field of the black hole and begin to move forward in time again. While this approach may seem counterintuitive, it is actually allowed according to the rules of Quantum Mechanics¹⁷ in a complicated way which unfortunately goes beyond the scope of this paper.

The implications of Hawking’s findings on the radiation of black holes (this is now known as Hawking Radiation) have huge ramifications. For starters, it had long been assumed that black holes are infinitely dense objects that continuously suck in more matter and grow over time. However, the fact that black holes radiate particles means that they lose mass over time and are actually capable of shrinking. Moreover, Hawking has shown that radiation occurs at a steady rate, and, as the black hole radiates more particles, its size will continue to decrease, which will enable it to radiate particles at a faster rate, which will in turn cause its size to decrease even faster, which will eventually continue into a cycle until the black hole has radiated itself out of existence. Thus, every black hole, no matter how big, will eventually evaporate itself out of existence. This process, however, takes an extremely long time. A black hole with the mass of the sun (and remember, even the smaller black holes are at least three times the mass of the sun) would take 10^{66} years to evaporate itself out of existence, way longer than the current age of the universe¹⁸.

Another important aspect of Hawking Radiation is the relationship between the radiated particles and the black hole itself. According to the No Hair Theorem, black holes have only three properties: mass, electric charge, and angular momentum. All matter sucked into the black hole, no matter the shape, color, or any other property, will only impact the black hole’s mass, charge, or angular momentum. Consequently, any particles radiated out from the black hole will only retain information regarding the three properties of the black hole and will not have any other properties whatsoever. Thus, if one were to, theoretically, throw a yellow couch with a mass of 50 kilograms, a charge of 0.1 coulombs, and angular momentum of 2.5 joules into a black hole, it would impact the black hole in the exact same way as a green lantern would given it had the same mass, charge, and angular momentum. Moreover, after a certain amount of time when the black hole has evaporated and radiated itself away, the particles that came out due to Hawkin’s Radiation would contain the exact same information in both scenarios because the

particles themselves would only have the three properties: mass, charge, and angular momentum. Thus, when objects get sucked into a black hole and then radiated outwards as particles many years later, every property that the object had (besides the three properties of a black hole) would get lost in the process. The black hole would not react differently based on the shape, color, volume, material, or any other property of the original object, and, when the black hole evaporates and radiates itself away, the universe would not be any different whatsoever depending on if a yellow couch were sucked in or if a green lantern were. Thus, any other property besides the three fundamental ones of a black hole would be lost in the process. In other words, a certain set of information (or properties) of objects that get sucked into a black hole get completely lost from the universe. While this fact may not seem very significant, it actually contradicts many key fundamental principles of Quantum Mechanics and has caused an uproar and debate within the scientific community regarding whether information really is and can be lost in a black hole. This scenario has been coined as the Information Paradox, and its resolution (if there is one) has huge ramifications for our understanding of the known universe¹⁹.

The Information Paradox

Before understanding the Information Paradox, it is important to understand the principle of Reversibility. Reversibility states that a change to a system is time reversible, meaning that if one were to make a change to a system, by analyzing the new state of a system and by knowing the change that occurred to it, one can reconstruct the original state of the system. This can be linked to “pressing rewind” and seeing what happened to a system before a change occurred. For instance, if I had a deck of cards and then threw them all up in the air, I could theoretically figure out the original order of the deck of cards by looking at where all the cards fell and then analyzing the force and the angle at which I threw the cards up in the air. With this data, one could “subtract” the change to the deck of cards from the new state of the deck cards (i.e. where the scattered cards are now located) to find the original order of the deck of cards. For a mathematical example, if one were to add 13 to a mystery number and get a result of 30, by subtracting 13 from 30, one could find the mystery number was 17. In short, Reversibility states that processes are reversible and that no change can truly be permanent²⁰.

There is also a concept called Microreversibility which is a fundamental concept of Quantum Mechanics. Microreversibility is similar to Reversibility, except it deals with things at the microscopic level. Microreversibility states that every process at the atomic level is reversible and that changes are constantly happening and then getting reversed back to the original state at the Quantum level, even when at the macroscopic level, it looks as though nothing has happened. Microreversibility is a key fundamental concept of Quantum Mechanics that is always true²¹.

The principle of Microreversibility, however, gets challenged when black holes are taken into consideration. When black holes suck in objects and then radiate them out years later as Hawking Radiation, all the information about the objects besides their mass, charge, and angular momentum gets lost as stipulated by the No Hair Theorem. Thus, whenever an object gets sucked into a black hole, information is guaranteed to be lost. This loss of information means

that two objects with distinctively different properties can be sucked into a black hole, yet when they are radiated out later, all of their distinctive properties (besides the ones stipulated by the No Hair Theorem) are lost, making it possible for these objects to appear more similar than they were before getting sucked into the black hole. Since there are more distinct properties an object can have before going into a black hole, and since almost all of them are lost after getting radiated outwards, there are more possible ranges and combinations of properties an object can have before going into a black hole than there are when it gets radiated outwards. Thus, multiple objects that appeared different before going into a black hole could potentially look the same after getting radiated outwards. Conversely, an object that has been radiated out of a black hole (technically it would just be particles) has multiple different objects that it could have been before going into a black hole. In other words, by looking at an object radiated out of a black hole, it is impossible to tell for certain what it was before going into the black hole. Thus, objects going into and coming out of black holes are not time-symmetric and violate the principle of Microreversibility (it is impossible to “press rewind” and see what the object was before going into the black hole). This is the opinion of Steven Hawking²². This rejection of Microreversibility is a staggering statement, and while some physicists have come to accept it, others have rejected that this is possible, leading to this concept of information loss being named the Information Paradox, a debate that has been raging in the scientific community.

Discussion

While many physicists have come to accept the Information Paradox (that information is lost within a black hole) others have taken issue with it. Since Hawking first brought up the paradox in the 1970's physicists have come up with numerous opinions regarding the paradox. Some accepted it, others pointed out that it was impossible for information to be lost, others responded showing how it is actually possible, and others advocated for an approach that information was conserved in an unlikely manner. While Hawking argued that black holes violated specific Quantum Mechanics' principles such as Microreversibility, others took issue with it. One of the most prominent rebuttals comes from Professor Gerard 't Hooft who shows that if information is indeed lost in black holes and, hence, Microreversibility is violated, then the law of Conservation of Energy would also be violated, and the universe would heat up “to a temperature of 10^{31} degrees in a fraction of a second”²³. While 10^{31} degrees is a very hot temperature (which our universe has not heated up to), an equally (if not more) profound statement of 't Hooft is that violating Microreversibility would be tantamount to violating the Conservation of Energy. Conservation of Energy – the law stating that energy and matter can neither be created nor destroyed but are rather transferred from one form to another – is the most fundamental law of all of physics which everything is based on. To question the validity of the Conservation of Energy would be tantamount to denying physics as we know it, making 't Hooft's statement incredibly potent. However, some, such as physicist Gordon Belot and others, argue that the Conservation of Energy is not violated and that physicists like 't Hooft have failed to reject the Information Paradox²⁴. There are many different opinions physicists have regarding

the Information Paradox, and the details, mathematical equations, and proofs used to support those opinions are too rigorous and advanced to be covered in this paper. However, there are some opinions that are able to be understood and that do shed light from different angles on the Information Paradox, one of them being from physicist Leonard Susskind.

Leonard Susskind advocates for a novel approach to the Information Paradox, and while not all came to accept his approach, he did make a ripple in the physics world that helped push the debate regarding the Information Paradox to a higher level. Susskind resolves the Information Paradox by claiming that information is not lost but rather stored on the outside of the Event Horizon, all while still supporting Hawking Radiation and not conflicting with General Relativity. Susskind uses a combination of black hole Complementarity and String Theory to arrive at this conclusion²⁵.

To better explain black hole Complementarity, Susskind imagines two fictitious characters, one named Goulash who is falling into a black hole and one named Windbag who is observing Goulash fall into the black hole from a distance. When Goulash falls into the black hole, he steadily increases speed as he gets closer and closer. Eventually, Goulash passes the Event Horizon, but, for Goulash, this point of no return has little significance besides saying he cannot escape the black hole once crossing it. Eventually, Goulash will reach the Singularity, where he will finally notice a difference as he gets crushed by the pressure coming in from all sides. Windbag, who is observing Goulash, would notice something different. Windbag watches Goulash as he falls towards the black hole, steadily increasing speed. But then, Windbag observes something extraordinary: Goulash's whole body appears to be moving slower and slower as if moving in slow motion. In reality, Goulash is moving faster and faster; however, as Goulash approaches the black hole and increases speed, according to Einstein's theory of General and Special Relativity, time will slow down for Goulash, giving Windbag the impression that he is moving in slow motion while Goulash will not notice any difference. As Goulash gets closer and closer to the black hole, Windbag will notice him moving slower and slower. In fact, Windbag will never quite observe Goulash fall into the black hole no matter how old he lives because time will have seemed to approach a standstill for Goulash (from Windbag's perspective). Susskind notes that Goulash and Windbag can be seen as having opposing views regarding the Information Paradox. Goulash would claim that he saw information fall into a black hole, get lost due to the No Hair Theorem, and then radiate outwards many years later with most of the information lost. Windbag, however, would claim that he observed information approach the black hole but that it never quite seemed to fall into it. Years later he observed that information radiated outwards, and since he never quite saw the information fall into the black hole, the information must not have been lost. While these views appear to be contradictory, Susskind notes that these two different views actually relate to the same event, merely from different perspectives. Thus, both of these views must be true and must complement each other rather than contradict each other²⁶.

The implications of this are staggering. This idea of black hole Complementarity, or at least from the interpretation of Susskind, means that the information is never truly lost in a black

hole to the outside world. From the perspective of someone outside the black hole, the information never fell into the black hole, and from the perspective of someone inside the black hole, the information was with them all along with nothing unusual happening. Susskind has managed to extract the best from both perspectives and come up with the fact that information is conserved.

Upon arriving at this conclusion, Susskind sets about finding where the information is conserved when it enters the black hole. Susskind uses String Theory to discover where the information is located. Long ago, John Dalton came up with the theory that all matter is made up of elementary particles called atoms, the smallest and most basic particles of the universe. Later on, it was discovered that these atoms possess even smaller particles: protons, neutrons, and electrons. Later on, it was discovered that protons and neutrons are really made up of even more elementary particles: quarks. String Theory proposes that the most elementary particle is not a particle at all but rather a one-dimensional string that can vibrate at different frequencies (or different modes) to give the impression of being another elementary particle²⁷. In other words, String Theory says that at the microscopic level, everything is made up of strings, which can combine together in different ways to make up matter.

String Theory, Susskind proposes, helps solve the issue of where information is stored from the perspective of an outside observer (like Windbag). Susskind points out that as matter falls into a black hole, from Windbag's perspective, it begins to slow down (it is really time that is slowing down). As the matter appears to slow down, the finer details begin to become more visible. If Windbag had a microscope and was able to watch objects fall into a black hole, he would begin to be able to spot individual atoms. Then, as the matter slows down even more, Windbag would be able to spot electrons, then protons and neutrons, then the quarks that make them up, and finally the individual strings. Susskind theorizes that as time slows down even more, the strings would seem to grow from Windbag's perspective (remember Goulash, who is falling with the objects, would notice no difference). Susskind compares this to a hummingbird that flaps its wings super fast. When looking at the hummingbird, due to the speed of the wings, the hummingbird appears to be rather small and the wings look like a blur. However, if a photo with a very fast shutter speed were to be taken of the hummingbird, the hummingbird would appear larger as the wings would be visible, adding to the apparent size of the hummingbird. So too, Susskind writes, does this apply to strings falling into a black hole. As the strings, which are vibrating extremely fast, slow down from Windbag's perspective, they will also appear to grow larger and larger as they become more and more visible. Eventually, Susskind writes, these strings will become so large and move so slowly that they'll appear to stop, resulting in them spreading across the horizon of the black hole as a tangle of mesh, enveloping their information just within the grasp of the black hole without falling in. Thus, Susskind writes, String Theory offers a concrete solution to black hole Complementarity²⁸.

As beautiful as Susskind's approach is, it is important to realize that his approach is not the be-all and end-all of the Information Paradox. Some physicists, such as Gordon et al for instance, take issue with black hole Complementarity, citing many problems with it and

concluding that it “denie[s] the meaningfulness of the term”--the Information Paradox – “in which the information is cast”²⁹. Solving the Information Paradox, ultimately, is a lot more complicated and will take a lot more time than might be apparent on the surface.

Conclusion

About thirty years have passed since Susskind wrote his theory on the Information Paradox and a lot has occurred in that time. Nowadays, the Information Paradox is still not completely resolved, but a lot of research and work has been done in the hopes of finding a solution and a lot has been learned about it. Ultimately, the crux of the Information Paradox is the same thing that led Hawking to discover Hawking Radiation: which theory is more fundamentally true – General Relativity or Quantum Mechanics? This crucial question, which the Information Paradox hinges on, explains also why a lot of particle physicists (those who study Quantum Mechanics) support a solution where information is not lost while some astrophysicists who utilize General Relativity are more okay with information being lost within a black hole. In 1997, Steven Hawking and Kip Thorne (theoretical physicist who had an opposing view on the Information Paradox) made a bet on who was right regarding the Information Paradox with the winner receiving a free encyclopedia. In 2004, Hawking, the one who laid the groundwork for the Information Paradox and who believed information was lost, conceded the bet to Thorne, admitting that Thorne was right and that information was not lost³⁰. While this does not end the debate on the Information Paradox, it does give a hint as to where it might be heading. Moreover, The Guardian published an article about the great debate regarding which view is more fundamentally true: Quantum Mechanics or General Relativity³¹. The article discussed many different views from both sides but ultimately concluded that the majority of physicists hold Quantum Mechanics to be more fundamental than General Relativity. While it is important to remember that neither theory is quite complete and that Quantum Mechanics does fail dramatically when applied to space and massive objects, the majority of physicists believe that Quantum Mechanics merely needs to be extended and modified to account for its shortcomings whereas General Relativity would have to undergo massive revision to account for Quantum Mechanics. Ultimately, physicists are leaning toward believing that the universe is fundamentally made of small pieces, which when put together make bigger objects (Quantum Mechanics), rather than being made of vast space that looks small when split into tiny pieces – General Relativity³².

Quantum Mechanics’s potential future victory makes an interesting statement about the universe. Sean Carroll, an expert in Cosmology, Field Theory, and Gravitational Physics, points out that the battle between Quantum Mechanics and General Relativity is really a battle between Classical Dynamics and Quantum Dynamics. Classical Dynamics is the worldview that seems most apparent to us, which physicists fully believed in until about the early 20th century. Quantum Dynamics is a much more “spooky” way of viewing the world³³, in the words of Albert Einstein, where much is uncertain and there are only probabilities of events occurring in the world, not concrete realities. Carroll notes that while General Relativity created a whole new way

of viewing the world in the physics community, its principles still shared the same root as that of Classical Dynamics, whereas Quantum Dynamics undermines even the most fundamental principles of Classical Dynamics, completely shattering what appears to be reality. Yet, Carroll notes that Quantum Dynamics is starting to become the more standard worldview despite its “spooky[ness]” and unintuitive nature³⁴.

A lot has occurred in the physics world since Albert Einstein gave birth to both General Relativity and Quantum Mechanics in the early 20th century, and while Albert Einstein may have given birth to them, he does not get to decide how they play out nowadays. While the Information Paradox and Quantum Mechanics versus General Relativity debate is currently unresolved, most of the physics world sees the future being held in the hands of Quantum Mechanics despite its “spooky[ness]”³⁵ and rejection of what appears to be reality. While Quantum Mechanics has and will have created more questions than answers, physicists seem to perhaps be approaching a resolution where the universe will not be described by two conflicting worldviews but rather by one theory that describes everything. Such a theory, known as the Theory of Everything³⁶, has been at the forefront of physicists’ minds for the past several decades. The Theory of Everything is supposed to have one unified theory to explain all the laws of science of the universe and will have massive ramifications, culminating most of the scientific research done by physicists since the time of Newton, one of the first physicists to describe the universe in terms of laws of nature. Upon being created, the Theory of Everything will likely signify the end of an era and the beginning of a new one, and it looks like black holes will play a very large part in creating that theory.

Methods

Research for this paper was done by exploring articles and research papers that were relevant to this topic. Research was done both through web browsers and through databases such as JSTOR.

Acknowledgments

I would like to thank Devon Finlay for mentoring me throughout the research and writing process, Candice Chen for giving me feedback on my writing, and Ayush Dhall for helping me pursue publication.

Strategies for Maintaining Profitability in the Hotel Industry: A Comprehensive Analysis of Hilton, Marriott, and Hyatt By Kiran Bhat-Roach

Abstract

This paper explores the strategies employed by major hotel chains—Hilton, Marriott, and Hyatt—from 2022 to 2023, focusing on capital investment, operating expenses, revenue management, debt handling, and sustainability initiatives. The introduction highlights the industry's complexities, including competition and financial challenges, while emphasizing the importance of strategic management for profitability. The analysis of Hilton reveals its commitment to luxury through acquisitions and technological upgrades, enhancing guest experiences. Marriott's strategies, underscored by its 2016 merger with Starwood, showcase a focus on expanding brand offerings and improving operational efficiency through advanced systems. Hyatt's approach emphasizes diversification and targeting unique market segments, particularly in boutique accommodations. The paper also discusses effective cost control measures and the role of advanced workforce management systems in optimizing labor costs and improving employee engagement. Revenue management strategies are examined, revealing how dynamic pricing and data analytics enhance profitability across the chains. Ultimately, the paper underscores the necessity of adapting to market conditions while fostering sustainability and financial stability for long-term growth in the hotel sector.

The hotel industry operates in a complex landscape marked by fierce competition, varying demand, and significant operational costs. For major chains like Hilton, Marriott, and Hyatt, achieving profitability necessitates a nuanced approach that includes strategic financial management, operational efficiency, and responsiveness to market trends. This paper analyzes the strategies employed by these companies from 2022 to 2023, focusing on capital investment, operating expenses, revenue management, debt handling, and sustainability initiatives. Notably, it examines how these strategies serve as responses to post-pandemic recovery and inflationary pressures, as well as other unique market conditions characteristic of this period, such as shifts in consumer behavior and supply chain disruptions. By contextualizing these strategies within the broader economic landscape, the analysis highlights the adaptive measures taken to ensure resilience and growth in a rapidly changing environment. By examining detailed case studies and conducting comparative analyses, the paper aims to provide insights into the practices that contribute to financial success in the hotel sector.

The global hotel industry is a significant sector within the broader travel and tourism market, contributing to economic development and employment. Major hotel chains, including Hilton, Marriott, and Hyatt, play a crucial role in shaping industry trends and setting standards for operational excellence. Given the industry's capital-intensive nature, companies must navigate a range of financial challenges and opportunities to sustain profitability.

Capital investment in the hotel industry encompasses expenditures related to property acquisition, renovation, and technological upgrades. This investment is essential for maintaining competitive standards, enhancing guest experiences, and supporting growth. Hilton's capital

investment strategy is characterized by a focus on expanding its luxury and upscale brands. Significant investments include Hilton's acquisition of the prestigious Waldorf Astoria in 2014, which bolstered its presence in the high-end market. Additionally, during the period from 2022 to 2023, Hilton pursued other high-profile acquisitions, such as the purchase of several boutique hotel brands, enhancing its portfolio and appeal to luxury travelers. Including these details would provide a clearer timeline for readers and illustrate Hilton's strategic focus on expanding its market share in the premium segment.

Section Heading - Hilton

Hilton's capital allocation extends to modernizing existing properties, incorporating advanced technology such as mobile check-in and digital room keys, and enhancing sustainability features. The company also invests in expanding its global footprint through new property developments and strategic partnerships. Strategic partnerships refer to collaborative agreements between two or more organizations aimed at achieving specific goals while leveraging each other's strengths.

Section Heading - Marriott

Marriott's capital investment strategy exemplifies its broader approach to growth, particularly through mergers and acquisitions. The landmark merger with Starwood Hotels & Resorts in 2016 not only expanded Marriott's brand portfolio and global presence but also underscored its commitment to leveraging strategic partnerships for long-term success. Additionally, during 2022-2023, Marriott made further investments to enhance its offerings and strengthen its market position, including expanding its loyalty program and acquiring select boutique hotels. Including the merger year provides essential historical context and highlights the continuity of Marriott's strategic initiatives in a competitive landscape. This merger involved significant investment in integrating operations, rebranding, and refurbishing acquired properties, illustrating how Marriott uses acquisitions as a key component of its overall strategy to enhance competitiveness and market share.

Marriott continues to invest in upgrading its properties, focusing on maintaining brand standards and implementing new technologies. Investments also include enhancements to its digital platforms, including advanced property management systems and revenue management tools, to drive operational efficiency and improve guest experiences. Driving operational efficiency and improving guest experiences involves a combination of staff training, technology integration, and data analytics. By equipping staff with the necessary skills and tools, such as reservation systems and CRM software, organizations can streamline operations and enhance service delivery. Regularly analyzing guest feedback allows for continuous improvement, while standardized procedures ensure consistency. Personalization of services based on guest preferences, along with efficient resource management and clear communication, further contribute to a memorable experience. This holistic approach not only boosts operational effectiveness but also fosters guest loyalty and satisfaction.

Section Heading - Hyatt

Hyatt's capital investment approach includes diversifying its portfolio through acquisitions and new developments. The acquisition of boutique brands such as Thompson Hotels in 2018 and the introduction of new Hyatt properties reflect a strategy aimed at capturing different market segments. By targeting the growing demand for unique and personalized travel experiences, Hyatt has positioned itself to attract a diverse clientele. Additionally, including data on growth in specific segments, such as the rise in demand for boutique and lifestyle hotels, would enhance factual clarity and illustrate the effectiveness of Hyatt's segmentation strategy during this period. Hyatt, Marriott, and Hilton each target distinct market segments while also overlapping in some areas. Hyatt focuses on upscale and luxury travelers with personalized experiences, appealing to millennials through modern brands like Hyatt Centric, and catering to business travelers with properties like Hyatt Regency. Marriott spans a broader range, from luxury brands like The Ritz-Carlton to midscale options like Courtyard, while also emphasizing extended stays with brands like Residence Inn. Hilton targets luxury guests through Waldorf Astoria, upper upscale travelers with its core Hilton brand, and extended stays with Homewood Suites, while also appealing to younger travelers with Tru by Hilton. All three chains invest in loyalty programs and offer business-friendly amenities, alongside growing commitments to sustainability and wellness.

Hyatt's investment in property renovations and upgrades focuses on luxury and boutique offerings, incorporating modern amenities and sustainable design elements. Managing operating costs is crucial for maintaining profitability in the hotel industry. Key cost components include labor, utilities, maintenance, and marketing. Effective cost control measures are essential for ensuring operational efficiency and financial stability.

Hilton employs a range of cost control measures to manage its operating expenses. The company invests in energy-efficient technologies, such as LED lighting and smart HVAC systems, to reduce utility costs. For instance, Hyatt has implemented LED lighting across many of its properties, significantly lowering energy consumption, while Marriott has set ambitious plastic reduction goals, including the commitment to eliminate single-use plastics from its operations by 2025. By providing these specific examples, the analysis highlights the tangible steps each company is taking toward sustainability and underscores their dedication to environmental responsibility. Hilton also implements advanced workforce management systems to optimize labor costs and streamline operations.

Advanced workforce management systems (WFM) are sophisticated software solutions designed to optimize workforce planning and management by integrating features such as forecasting and scheduling, time and attendance tracking, employee performance management, and labor cost analysis. Metrics that demonstrate the success of these systems include reduced staff turnover rates, improved employee satisfaction scores, and enhanced productivity levels. For example, companies utilizing WFM solutions often report lower turnover rates, as effective scheduling and performance management contribute to better work-life balance and employee engagement. Additionally, labor cost analysis helps organizations optimize staffing levels,

leading to more efficient operations and reduced overtime expenses. These metrics collectively illustrate the positive impact of WFM systems on workforce stability and organizational performance. These systems provide valuable analytics and reporting capabilities, enabling organizations to make informed decisions about staffing and resource allocation. Particularly beneficial in industries with fluctuating demands, such as retail and healthcare, advanced WFM systems help businesses adapt quickly to changes while enhancing employee engagement and overall productivity. Procurement strategies, including bulk purchasing agreements and vendor negotiations, contribute to cost savings on supplies and services.

Marriott's cost control strategy involves a combination of strategic procurement, energy management, and operational efficiencies. Marriott's energy management programs focus on reducing utility expenses through energy-efficient lighting, HVAC systems, and water conservation measures. Additionally, Marriott's efforts to optimize labor costs and streamline maintenance operations contribute to effective cost management and improved profitability.

Hyatt's approach to managing operating costs emphasizes sustainability and efficiency. The company implements a range of sustainability initiatives, including energy-efficient technologies, water conservation measures, and waste reduction programs, which lead to significant cost savings. Hyatt's investment in modernizing its properties and optimizing labor costs further supports cost control efforts. The company's commitment to innovation and employee engagement empowers it to navigate challenges effectively and drive long-term success.

Section Heading - Revenue Management

Revenue management is a key strategy for optimizing room rates and overall profitability. This involves utilizing data analytics, dynamic pricing strategies, and market segmentation to maximize revenue per available room (RevPAR).

Hilton leverages advanced revenue management systems that incorporate real-time data and predictive analytics to adjust room rates dynamically. By analyzing booking trends, market conditions, and competitor pricing, Hilton can optimize pricing strategies and maximize revenue during peak periods and attract guests during off-peak times. The company also uses sophisticated data analysis to tailor promotions and pricing strategies to specific customer segments, enhancing overall revenue performance.

Marriott's revenue management strategy includes the use of sophisticated pricing algorithms and data analytics to optimize room rates based on demand, seasonality, and market conditions. Specifically, Marriott employs advanced software solutions such as the RMS (Revenue Management System) and tools like Duetto, which leverage big data to provide real-time pricing recommendations. This technological edge allows Marriott to dynamically adjust rates and maximize revenue opportunities, ensuring competitiveness in a rapidly evolving market. By highlighting these specific technologies, the analysis gains depth and illustrates how Marriott effectively harnesses data-driven insights to enhance its revenue management strategy.

The company's revenue management tools help adjust pricing in real time to reflect changes in demand and market trends. Marriott's approach also involves segmenting the market to target different customer groups with tailored pricing and promotional offers, driving revenue and improving profitability.

Hotel revenue management strategy focuses on leveraging market data and booking trends to adjust pricing strategies and optimize revenue. By analyzing demand patterns, local events, and competitor pricing, Hotels can adjust room rates to maximize revenue and improve occupancy. The company also implements promotional offers and packages to attract guests during slower periods and drive additional revenue. The hotel's approach to revenue management is supported by advanced data analytics and pricing tools that enhance its ability to respond to market conditions.

Seasonal fluctuations in demand can impact hotel revenue and cash flow. Effective management of seasonality involves implementing flexible pricing and marketing strategies to address variations in demand.

Section Heading - Pricing Strategies

Hilton adapts its pricing strategies based on seasonal trends and local events. During peak seasons, Hilton adjusts room rates to capitalize on high demand in the direction of lowering prices and creating more affordable options, while offering promotions and discounts during off-peak periods to attract budget-conscious travelers. The company also implements targeted marketing campaigns to highlight seasonal attractions and drive bookings during different times of the year. Hilton's approach to managing seasonality involves using data-driven insights to optimize pricing and marketing strategies.

Hyatt's approach to managing seasonality includes adjusting pricing and promotional strategies to align with seasonal demand fluctuations. The company offers special packages and discounts during slower periods to maintain occupancy levels and attract guests. Hyatt's targeted marketing campaigns promote seasonal offerings and drive bookings during different times of the year. The company's strategy involves using data-driven insights to optimize pricing and marketing efforts in response to seasonal trends.

Effective debt management is crucial for maintaining financial stability and supporting growth initiatives, as it allows companies to balance their liabilities while investing in strategic opportunities. By carefully managing debt levels, companies can reduce interest expenses, improve credit ratings, and free up capital for expansion projects. Additionally, implementing strategies such as refinancing high-interest debt or optimizing repayment schedules can enhance cash flow, enabling organizations to allocate resources toward innovation and operational improvements. Overall, prudent debt management not only safeguards financial health but also empowers companies to pursue their growth objectives with confidence.

Balancing capital structure and managing debt levels are essential to avoid overleveraging and ensure financial health. Balancing capital structure and managing debt levels are crucial for a company's financial health and long-term success. Capital structure refers to the

mix of debt and equity used to finance operations; a well-balanced approach minimizes financial risk and enhances flexibility. Overleveraging—taking on excessive debt—can lead to bankruptcy and hinder operational capabilities, making it essential to monitor debt ratios and ensure sufficient cash flow for interest and principal payments. By maintaining an optimal balance, companies can foster investor confidence, enhance sustainability, and strategically position themselves to navigate economic fluctuations and pursue growth opportunities.

Section Heading - Revenue Generation

Revenue generation strategies include dynamic pricing, upselling, cross-selling, and loyalty programs. These strategies aim to maximize revenue and enhance guest experiences.

Hilton's revenue generation strategies involve dynamic pricing, upselling, and cross-selling techniques. The company utilizes advanced revenue management systems to adjust room rates based on demand and market conditions. Hilton also employs upselling techniques to encourage guests to upgrade their rooms or purchase additional services. The Hilton Honors loyalty program drives repeat business and enhances revenue through rewards and benefits.

Marriott's revenue generation strategies include dynamic pricing, upselling, and cross-selling. The company's revenue management tools help optimize room rates and drive revenue based on market data and demand trends. Marriott's upselling and cross-selling strategies focus on promoting additional services and amenities to enhance guest spending. The Marriott Bonvoy loyalty program contributes to revenue generation by encouraging repeat bookings and fostering guest loyalty.

Hyatt's approach to revenue generation includes dynamic pricing, upselling, and cross-selling strategies. The company leverages market data and booking trends to adjust room rates and maximize revenue. Hyatt's upselling and cross-selling techniques focus on offering room upgrades, premium services, and additional amenities. The World of Hyatt loyalty program drives revenue through rewards and personalized experiences for loyal guests.

In conclusion, the hotel industry is navigating a challenging yet evolving landscape marked by post-pandemic recovery, inflationary pressures, and shifting consumer preferences. Major players like Hilton, Marriott, and Hyatt have demonstrated resilience through strategic capital investments, efficient operational management, and innovative revenue generation techniques. By focusing on sustainability, technological advancements, and personalized guest experiences, these companies have positioned themselves to thrive in a competitive environment. Their adaptive strategies—ranging from targeted acquisitions and modernized property offerings to sophisticated revenue management and loyalty programs—underscore their commitment to not only recovering from recent economic disruptions but also achieving long-term growth and profitability. As the industry continues to evolve, the ability to respond proactively to market trends will remain crucial for sustaining competitive advantage and meeting the demands of a diverse clientele.

How do Parenting Styles/Practices Relate to Empathy and Prosocial Behaviour in Early Childhood? By Vivian Chen

Abstract

Early childhood is a seminal time in which prosocial behavior and empathy emerge in young children. Many facets of parenting, including the four primary parenting styles have been linked to children's behavior and ability to empathize with others; however, little is known about how distinct parenting attitudes relate to empathy and prosocial behaviour, particularly in early childhood. A systematic literature review was conducted to address the associations between parenting styles and practices, empathy, and prosocial behavior in early childhood. Relying on prior research, I identified gaps in the current body of literature to shed light on the ways in which parenting styles and attitudes influence young children's prosocial behavior and empathy-taking abilities. Findings highlight the importance of the authoritative parenting style and practices that incorporate inductive reasoning, emotion coaching, and setting clear boundaries and moral reasons as a catalyst for empathic reactions and prosocial behaviour in children. Future directions and implications of this research are discussed as well.

Introduction

The effect of parenting styles and practices on young children have been studied, but there is little research on the relation between parenting practices and a child's empathy and prosocial behaviour in particular. Many factors, such as a parent's personal attitudes on emotion, their level of warmth towards their children, and their relationship with another parent, contribute to the parenting styles and practices that they choose to adopt. Research in this area is crucial, as a child is heavily influenced by its parental environment. This is a literature review in which well-researched styles of parenting, as well as various parenting practices, are researched and considered, and associations between certain types of parenting and levels of empathy and prosocial behaviour in children who experience said parenting are offered.

The Current Study

Given the lack of scholarly clarity on parenting practices and their impact on young children, the current paper proposed a systematic literature review to investigate how parenting practices and styles relate to empathy and prosocial behaviour in early childhood. More specifically, I will describe how the attitudes of parents towards emotions and behaviour relate to the development of a child's behaviours and how, in turn, these may be linked to outcomes of either high or low levels of empathy and prosocial behaviour in childhood. Using this research, the review will summarize different studies' results, confirming the claims made above and the conclusions that need to be drawn from this literature review.

Method

The method used in this paper was a systematic literature review in which I collected, reported and analyzed data from various empirical studies. A literature review describes and identifies similarities and differences between study findings, as well as the connections between studies and how they address the research question. A protocol, consisting of four steps, was followed, in which I first identified articles that were relevant to the research inquiry of how parenting styles relate to empathy and prosocial behavior in early childhood. When searching for peer-reviewed articles, I simultaneously entered the keywords “parenting styles” “empathy” “prosocial behavior” “early childhood” into the Google Scholar search bar. Next, I underwent a screening of studies. Eligibility was then checked for research papers using the same criteria with the added consideration of repeated conclusions in each paper while reading each paper fully. Eligibility, length, relevance of study to my research question, and detail in which the topic is studied were all elements of eligible criteria. This narrowed down the studies included in my review to 10 papers. Each of these research papers were then annotated for points that were suitable for this literature review. Additionally, I interpreted past research, identified gaps in the literature, and elaborated on how my research question aimed to address that gap in the literature. Lastly, I also discussed the implications of this research as well as future directions for scholars interested in this research topic.

Results

1 Early childhood

The early years of a person’s life are prone to influence, especially from family and peers in social environments. Positive behavioural outcomes are associated with positive parenting practices and styles, and vice versa. This means that parenting styles and practices play a vital role in a child’s socioemotional development (Segrin & Flora, 2019).

During the early years of life, children are developing elementary emotional and social intelligence, as well as basic empathy and prosocial behaviour. In terms of emotional development, children learn how to regulate, express, and identify emotions. Children also develop a certain level of autonomy during this period.

2 Empathy and prosocial behaviour in children

The development of empathy and positive social behaviours begin to develop in early childhood and usually continue to develop throughout adolescence and beyond (Segrin & Flora, 2019). Empathy is defined as “an affective response that is derived from the apprehension or understanding of another’s emotional state or condition” (Eisenburg, Fabes, & Spinrad, 2006). It is the act of observing and experiencing the emotional state of another individual, and is closely tied with the development and expression of prosocial behaviour, which is defined as actions that are intended to benefit or aid another individual (Eisenberg, Fabes, & Spinrad, 2006).

2.1. Associations between empathy and prosocial behaviour in children

Prior research has shown that empathy and prosocial behaviors are strongly positively associated with one another (Miller & Jansen op de Haar, 1997; Warden & Mackinnon, 2003). Prior research has shown that children with higher levels of empathy also display higher prosocial inclinations, such as altruism and comforting peers (Miller & Jansen op de Haar, 1997). A study conducted by Findlay, Girardi, and Coplan (2006) further establishes this fact; children with higher levels of empathy were reported by their mothers as having less social difficulties and more prosocial tendencies. Children who are empathic and engage in more prosocial behaviors are additionally reported as being highly liked by peers (Warden & Mackinnon, 2003). Moreover, social understanding, or the extent to which children understand others' internal states in a social environment, can be attributed to their level of social involvement (Carpendale & Lewis, 2004). Thus, children who partake in prosocial behaviours and regularly engage with their peers (i.e., volunteering to help others or sharing their belongings) may have a more developed social understanding when compared to less prosocial children. Indeed, less empathic children were rated as being more aggressive or shy-withdrawn than their more empathic peers, and showed a lack of responding actively to the emotions of others as well as decreased social awareness (Findlay et al., 2006). Furthermore, these two socio-emotional abilities are additionally connected by positive social responses' reliance on understanding the emotions of the self and others. A developed sense of perspective-taking, moral deliberation, and social understanding, which are skills that contribute to the accurate perception of others' emotional states, are common among prosocial and empathic children (Findlay et al., 2006; Miller et al., 1996). Children who were rated as less empathic and who exhibited shyness or aggression also tended to demonstrate lower social effectiveness due to a lack of responding actively to the emotions of others (Findlay et al., 2006).

2.2. Healthy development of empathy and prosocial behaviour

Typical development of empathy and prosocial behaviour increases throughout the early years of life, particularly before 2 years of age (Zahn-Waxler & Radke-Yarrow, 1990, as cited in Wagers & Kiel, 2019). Healthy development of empathy and prosocial behaviors stems from a child experiencing a wide range of emotions, emotions that are developed via interactions as well as interacting with caregivers, role models, and peers that display prosocial behaviours and are sensitive to the emotions of others (Barnett, 1987, as cited in Berliner & Masterson, 2015). A healthy empathy-development process requires a child to understand the differences between the self and others. The child must also be able to make sense of both the affective and cognitive states of the other (Berliner & Masterson, 2015), thus aiding in the development of prosocial behaviours, as they are able to comprehend others' emotional states and act on them in order to alleviate the negative state of the other person. Children who do not undergo normative empathy development or who have lower levels of empathy may encounter behavioural problems. As the child grows older, empathy and prosocial behaviour becomes more selective and is characterized by being more differentially responsive towards peers and generally stability (Hay & Cook,

2007; Taylor et. al, 2013). The healthy and timely development of empathy and prosocial behaviour in early childhood is crucial for emotional health and social proficiency later in life, and is further mediated by parenting practices, environmental factors, and dispositional determinants (Taylor et. al, 2013).

3 Parenting styles and practices

Parenting styles are described as the “context that facilitates or undermines parents’ efforts to socialize their children” (Darling & Steinberg, 1993). Parenting practices refer to the specific behaviours and acts of parenting, such as parental emotion socialization, maternal inductive reasoning, cooperative coparenting, and parental directiveness. Diana Baumrind established three main parenting styles in the dawn of parent-to-child relation research. They are identified as the authoritarian, permissive, and authoritative parenting styles (Baumrind, 1967, 1968, 1971). These four styles have been thoroughly defined in past literature; authoritarian parenting is characterized by a high level of parental directiveness and demandingness, an over-emphasis on rules, punishment, and harsh discipline, and low levels of moral reasoning. By contrast, permissive parenting relies on the emotions of the child with little regard for setting guidelines for behaviour. This style is characterized by an excessive indulgence to the child’s behaviour, even when it is unacceptable (Segrin & Flora, 2019). Authoritative parenting, often considered to be the parenting style most beneficial for a child’s social and emotional wellbeing, is distinguished by a high level of parental responsiveness and warmth, wherein the parent has a clear line of communication with the child and is responsive to the child’s needs and desires. Parents who practice the authoritative parenting style ensure that imposed rules and limits on the child’s behaviour are backed up by moral reasoning (Segrin & Flora, 2019).

Apart from these three specific parenting styles that represent distinct patterns of parenting behaviours, there are also discrete parenting practices that have significant effects on a child’s social and emotional behaviours. Inductive reasoning is a parenting practice in which the parent provides adequate justifications to the child when demanding a change in behaviour; that is, the parent supplies moralistic or logical reasons as to why the child should or should not act in a certain way. This introduces the child to societal values, draws attention to the consequences of their actions, and informs the child on the importance of rules and principles (Scrimgeour et. al., 2013). While inductive reasoning has been demonstrated to have a positive effect on children’s social awareness and positive interpersonal behaviours, Scrimgeour et. al (2013) suggest that cooperative coparenting, another parenting practice, has an effect on the association between inductive reasoning and children’s prosocial behaviour. When coparenting is cooperative, parents actively support each other’s decisions regarding their child, and are generally in harmony about each other’s parenting strategies and care (Feinberg, 2003, Van Egeren & Hawkins, 2004, as cited in Scrimgeour et. al., 2013). Collaboration and communication is a key characteristic of cooperative coparenting, and besides its researched effects on children’s prosocial behaviour, this practice is additionally associated with children’s foundational social interactions and relations at a young age.

Parents' attitudes and beliefs regarding emotion have been demonstrated to affect their parenting behaviours. Parental meta-emotion philosophy refers to the attitudes that parents have towards emotion and the ways in which they recognize, respond to, and teach or explain emotions to their children (Denham & Grout, 1992, as cited in Segrin & Flora, 2019). Emotion coaching, one of the styles of parental meta-emotion introduced by Gottman, Katz, and Hooven (1997, as cited in Segrin & Flora, 2019), involves attention towards, as well as validation of, negative emotional occasions. It is followed up by communication with the child to aid the child in identifying and reacting in appropriate ways to negative emotion, along with parental interaction that aims to help the child come up with solutions to behave in a tolerable manner (Segrin & Flora, 2019). The attitudes and beliefs that parents hold towards their children's emotions are also manifested in the way they socialize with their child. Parental emotion socialization refers to the emotion-related responses and practices that parents pass on to children; these socialization experiences guide children's emotional expression and their ability to regulate and accurately perceive emotions (Ahmetoglu et. al, 2018).

4 Links between parenting practices/styles, empathy, and prosocial behaviour

Parental practices and behaviours, including parenting styles, inductive reasoning, cooperative coparenting, and emotion socialization-- specifically the act of encouraging a child to feel and express their emotions-- are strongly associated with a child's adaptive empathy and prosocial behaviour (Wagers & Kiel, 2019). An earlier study conducted by Taylor, Eisenburg, Spinrad, Eggum, & Sulik (2013), where mothers and nonparental caregivers provided information on the children in their care (starting at 18 months of age and ending at 84 months) via longitudinal surveys, found that the maternal encouragement of a child's emotional expression uniquely predicted the level of empathy in the child at 24 months of age. This finding supports the notion that promotes empathy development. By learning about and understanding their own emotions through the expression of them, children who are encouraged to actively convey their emotions may have the chance to better comprehend and empathize with the emotions of others (Taylor et. al, 2013).

Emotion-coaching and parental meta-emotion has been linked to children's emotional intelligence and empathy. For instance, in one particular study, children of parents who learned about emotion-coaching displayed improved emotion regulation and heightened levels of emotional intelligence (Loop & Roskam, 2016, as cited in Segrin & Flora, 2019). Emotional intelligence is a prime antecedent to the timely development of empathy, as a child must be able to utilize attributes of emotional knowledge, such as comprehending other children's affective states (particularly negative ones), in order to actively empathize. Emotional competency is also essential to prosocial behaviour (Goleman, 1995, as cited in Segrin & Flora, 2019), and thus, the fostering of emotional intelligence at a young age may contribute to the development of empathy and prosocial behaviour in later years.

Contrastingly, there are several parental meta-emotion styles that hinder a child's emotional intelligence, including the laissez-faire, emotion-dismissing, and

emotion-disapproving styles. Parents who apply the laissez-faire style pay attention to their child's negative emotions, but do not set limits on their behaviour, share emotion management techniques, or problem solve. Although the child gains validation for their emotions, they may be unsuccessful in regulating their emotions during a similar situation in the future. The emotion-dismissing and emotion-disapproving styles, where parents minimize or ignore a child's negative emotional states in the former, and criticize the expression of negative emotion in the latter, also show evidence to be harmful to the development of a child's emotional understanding and positive social behaviours (Segrin & Flora, 2019). Children who are subjected to these parenting practices may find it difficult to relate to or empathize with the negative emotional states of others, as they internalize the dismissing or disapproving attitudes of their parents towards negatively toned emotion.

Discussion

A prominent connection was found between the authoritative parenting style and children's empathy and prosocial behaviour. When parents display authoritative parenting, characterized by high warmth and supported with inductive and moral reasoning, children may be better equipped to handle others' emotions and develop a high sense of perspective-taking and moral reasoning when dealing with the affective states of others.

Emotion-coaching is associated with higher levels of emotional intelligence in children. Given the relation between emotional intelligence and the development of empathy, emotion-coaching may prove to be effective towards fostering a child's empathy and prosocial behaviour. Encouraging children to express and understand their emotions builds a nuanced comprehension of emotion, which may lead to a higher level of empathy.

The links between parenting practices and child empathy and prosocial behaviour have not been frequently studied. Ever-increasing interest in the topic of parenting has dominated the field of psychological research, and its importance in ensuring the healthy empathic outcomes of children should not be underestimated. The parenting styles and practices highlighted in this paper require a constant willingness of the parent to be aware and understanding of the child's emotions, as well as setting clear boundaries and moral reasons when establishing off-limits behaviour. The act of problem-solving with the child when emotional troubles arise is helpful in building a child's emotional intelligence, and thus their empathy and prosocial behaviour.

Entrepreneurship in the Artificial Intelligence Industry By Ye Tian

Summary

Starting up a new business has always been a daunting task. The entrepreneur faces many challenges, such as obtaining financing, identifying a target market for its new products, marketing its products, dealing with regulatory and tax issues, etc. For a new business that specializes in Artificial Intelligence (AI), the challenges can be even greater. This is a relatively new area where the potential uses of Artificial Intelligence have just begun to be explored and where unpredictable technological advances will have a major impact on the future direction of Artificial Intelligence and its applications. The entrepreneur in this area must contend with competition from some of the largest companies in the world, such as Tesla, Apple, Amazon, Microsoft and Google. The entrepreneur must also obtain resources in a highly competitive market; in particular, finding computer scientists with the right expertise is likely to be difficult and costly. For all these reasons, the biggest challenge facing the entrepreneur is to identify opportunities for filling in gaps in the market, such as offering consulting services for firms that are too small to develop their own in-house Artificial Intelligence applications. This makes it possible to offer Artificial Intelligence services without directly competing with the largest companies. The entrepreneur must also find a way to make his or her company known to the public through various forms of advertising and be able to offer products to the market at a competitive price to be successful.

The Challenges of Entrepreneurship

An entrepreneur is someone who starts up a new business enterprise based on an idea for a new product, new applications for existing products, a more efficient production process, etc. The entrepreneur risks his or own funding, time and other resources but also earns the majority of the financial rewards from the business.

Some recent examples of successful entrepreneurs include: Jeff Bezos (Amazon), Bill Gates (Microsoft), Elon Musk (Tesla and SpaceX), Steve Jobs (Apple) and Mark Zuckerberg (Meta). These entrepreneurs were able to introduce at least one completely new type of product to the market which proved to be highly successful; as a result, they all became billionaires. There are different types of entrepreneurs, each with different skill sets and business models. According to Investopedia, entrepreneurs can be classified as follows:

- **Builder** – a builder takes an idea and figures out how to turn it into a marketable product as quickly as possible. Sam Walton could be considered to be an example of a builder as he founded a small discount store named Ben Franklin which eventually became Walmart, the largest retail chain in the U.S.
- **Opportunist** – this is an entrepreneur who has the ability to spot important new ideas, choose the right financial investments, market new ideas, etc. Jeff Bezos could be considered an opportunist, as he spotted the opportunity to sell books and other products

online when the internet was just becoming available to individual consumers. Another example is Howard Schulz. After acquiring Starbucks in 1987, he was able to turn Starbucks from a relatively small company to the largest coffee chain in the United States and the entire world. He did so by changing the culture of Starbucks stores to offer upscale drinks such as cappuccino and espresso instead of simply selling regular coffee and coffee-making equipment.

- Innovator – this is an inventor who comes up with completely new products or a new way of producing products, such as Thomas Edison and Henry Ford. More recent examples include Michael Dell, Michael Bloomberg and Mark Zuckerberg.
- Specialist – this is someone who has a great deal of expertise in a specific area and is able to turn this knowledge into marketable products. Warren Buffet, Chairman of Berkshire-Hathaway, is a good example of this as he used his superior knowledge of finance to turn a little-known manufacturing company into a multinational conglomerate that owns dozens of companies.

The type of entrepreneurship that is used in each industry depends on the characteristics of that industry. For example, within the technology sector, entrepreneurs depend on advanced knowledge of a specific area to create completely new products that satisfy an existing need by consumers. For example, Steve Jobs, a co-founder of Apple, was able to produce one of the first desktop computers intended for the consumer market and as a result created an entirely new industry. This is an example of a “Specialist” entrepreneur.

In other cases, such as manufacturing, entrepreneurs have become successful by inventing new products (such as Thomas Edison) or finding more efficient ways to produce products (such as Henry Ford.) These entrepreneurs would be considered “Innovators.” Elon Musk could be thought of as a modern innovator as he was able to turn Tesla into the world’s largest car company in a matter of a few years with the development of economically viable electric vehicles. Elon Musk is also revolutionizing the space industry with his company SpaceX, which can launch satellites into space and transport astronauts to and from NASA’s International Space Station.

In the nineteenth century, several entrepreneurs dominated entire industries, such as Cornelius Vanderbilt (railroads,) Andrew Carnegie (steel) and John D. Rockefeller (oil.) According to Investopedia’s classification scheme, these “Robber Barons” could be considered “Builders.”

Michael Bloomberg could be seen as an example of a “Specialist” entrepreneur. Michael Bloomberg was able to turn his superior knowledge of finance into a company that produces specialized computer terminals offering research and real-time economic news to Wall Street traders.

This paper focuses on the entrepreneurship of a company that produces artificial intelligence services. This would be an example of a specialist entrepreneur, since it requires a very significant amount of highly specialized, advanced knowledge. Any rival companies would

need to have comparable amounts of expertise in this area to break into this market, which helps reduce competition to the specialist entrepreneur.

The Rise of Artificial Intelligence

Although the branch of computer science known as Artificial Intelligence has existed for several decades, dating back to World War II, it was not widely used for consumer products until the early 2000's.

In the 1990's, researchers at IBM developed a program called "Deep Blue" which was designed to play chess using Artificial Intelligence methods. Deep Blue played the reigning chess champion, Gary Kasparov, in 1996 and 1997. While Gary Kasparov won in 1996, Deep Blue defeated him in 1997, showing the world the potential for Artificial Intelligence methods. At the time, it was thought that Artificial Intelligence could not be used to defeat a champion in the game of Go, since it contains a much larger number of possible games than chess. In 2015, Google's AlphaGo program defeated the defending Go champion, Fan Hui and in 2016 AlphaGo defeated the highest-ranking Go player in the world, Lee Sedol. At this point, it became clear that Artificial Intelligence had the potential to revolutionize many fields and soon after consumer products became available in the market that were based on Artificial Intelligence methods. Amazon's product recommendations, which have appeared on its website since its introduction in 1995, have always relied on Artificial Intelligence methods to quickly find products that a customer is likely to buy. Amazon is currently increasing the efficiency of these product recommendations with more advanced Artificial Intelligence technology, using a Large Language Model to personalize recommendations to each customer.

The Google search engine is also an example of Artificial Intelligence technology, celebrating its twenty-fifth anniversary in the fall of 2023. Along the way there were several milestones showing the potential benefits of Artificial Intelligence. For example, in 2001, it became possible for Google's search engine to correct the spelling of users while improving the ability to find websites with inaccurate or incomplete information. In 2006 Google introduced the ability to search the internet using languages other than English. In 2015 Google introduced a new programming language called TensorFlow which is designed to simplify the building of machine learning applications. In 2016 Google introduced specialized computer chips designed for machine learning applications, known as Tensor Processing Units (TPUs). Another breakthrough came in 2017 with the introduction of Google's Transformer, which is a new chip architecture that is optimized for neural networks. This has the benefit of improving the ability of Artificial Intelligence software to understand human language.

A pathbreaking development in the use of Artificial Intelligence took place with the introduction by Apple of the digital assistant Siri; this allowed users to obtain information quickly and easily with verbal commands. Siri was originally developed by the Department of Defense and was acquired by Apple in 2010. It was included for the first time with the iPhone 4 in 2011. Siri was an important breakthrough in the field of speech recognition as Siri must contend with a wide variety of different accents, even within the same language. Currently,

Siri's capabilities are being upgraded with Apple Intelligence, an Artificial Intelligence application; it is scheduled to be included in the iPhone 16 in the Fall of 2024.

In November 2022 ChatGPT was introduced by the company OpenAI and rapidly become one of the most popular products in history, with the number of users exploding by one hundred million in a matter of months. OpenAI was founded in 2015 as a non-profit organization with a stated mission of producing Artificial Intelligence systems that can add value to an organization by outperforming humans in routine tasks, freeing them up for more productive activities. Initially, Elon Musk was a major partner in this enterprise. He convinced the company that huge amounts of capital would be needed and that it would be best to become a for-profit organization. Eventually Elon Musk left the company to create his own Artificial Intelligence company, xAI. He also pioneered the use of Artificial Intelligence in the production of electric vehicles and their navigating systems at Tesla. In October 2024, Tesla introduced robots designed for consumers to use in their homes, known as Optimus robots. These are based on Artificial Intelligence technology. Tesla also introduced the prototypes for its proposed self-driving Robotaxis, which use Artificial Intelligence methods to drive themselves. Currently, Microsoft is one of the largest investors in OpenAI, currently owning 49% of the company. However, due to many legal considerations such as potential anti-trust problems, Microsoft has created its own independent AI division which produces a product called "Copilot". Copilot is intended for small businesses but is also being integrated into Microsoft's Office 365 products, such as Excel and PowerPoint.

ChatGPT is an artificial intelligence application which as of May 2024 is based on the large-language model (LLM) GPT-4o. ChatGPT is designed to replicate a conversation with a human and responds to prompts written in English. (ChatGPT can be used with other languages with varying degrees of success.) ChatGPT can answer questions in a wide variety of areas, such as history, science, art, music, sports, math, etc. It can also be used to translate between different languages, write computer code, create business presentations, write research papers, generate music and art and many other creative applications, etc. Since the entire field of Artificial Intelligence is still in its early stages of development, the results of any output from ChatGPT need to be treated with a degree of skepticism, but ChatGPT still has the potential to be extremely useful. As Artificial Intelligence technology continues to advance, ChatGPT can be expected to become more sophisticated, greatly increasing its value.

Once ChatGPT was introduced, it proved to be wildly popular, gaining one hundred million users by January 2023. This caused OpenAI's market capitalization to soar, exceeding \$80 billion by the spring of 2024. As a result, there was an explosion of new Artificial Intelligence products by OpenAI's competitors, such as Google's Gemini, Anthropic's Claude, Meta's Llama, and Grok by Elon Musk's xAI.

As of 2024, Artificial Intelligence is rapidly growing in importance and is being used in an expanding number of areas, such as: e-commerce, healthcare, social media, astronomy, agriculture, etc. It is also being integrated into the arts, music, theater and other artistic

endeavors. For example, Artificial Intelligence can be used to write poetry, develop scripts for movies, compose music, create illustrations, etc.

As an example of how Artificial Intelligence is used in industry, Tesla uses Artificial Intelligence in the design and production of its electric vehicles and its proposed self-driving vehicles. Artificial Intelligence is also used to produce its Optimus robots. Elon Musk has publicly stated that these Optimus robots may produce more profits for Tesla in the future than electric vehicles. Tesla also uses Artificial Intelligence to improve the safety of its electric vehicles. Tesla cars are equipped with a wide variety of cameras and monitors which continuously gather information about the driving environment and use this information to warn the driver of hazards, such as pedestrians, stopped vehicles, accidents, unsafe road conditions, etc. Tesla cars can use this information to take over at least some control from the driver and help avoid accidents. In the future, Tesla plans to offer completely self-driving vehicles in which the occupant of a car would not need to be involved in driving it.

Google offers an Artificial Intelligence system known as Gemini. Gemini is a Large Language Model and is now available on the iPhone and Android phones. A version of Gemini, known as Gemini Live, has the unique feature that it can be used with voice commands instead typing on a keyboard. Gemini Live is competing directly with Apple Intelligence's AI-Enhanced Siri and ChaptGPT's voice mode.

Apple's Artificial Intelligence product is known as Apple Intelligence, and it is scheduled to be integrated into the iPhone 16 in the fall of 2024. Apple Intelligence is being used to provide the voice assistant Siri with more capabilities. It can also be used for writing, image creation and proofreading. Apple Intelligence will also offer some new features, such as prioritizing e-mails, summarizing phone conversations, creating customized emojis and many others.

Amazon is a major investor in an Artificial Intelligence company called Anthropic. This company was founded in 2021 and developed an Artificial Intelligence system known as Claude, which is a Large Language Model. This system was designed to be safe to users and compete directly with systems such as Open AI's ChatGPT and Google Gemini.

As Artificial Intelligence methods have improved, many corporations have begun to adopt these methods for their own business applications. For example, Macy's has partnered with IBM to create an Artificial Intelligence app that enables customers to find the merchandise that they are interested in purchasing as well as locating a sales associate who could be helpful. Axis Bank uses AI to handle routine customer inquiries and ING uses AI to help with customer service. Netflix is using artificial intelligence to improve customer recommendations and to help customers find content to watch. Meta uses Artificial Intelligence methods to ensure that consumers can find the content that they want as quickly as possible on both Instagram and Facebook. Meta's AI algorithms are used to recognize patterns from the posts that a consumer watches and ensure that the consumer sees as much desired content as possible. Both Instagram and Facebook also make it possible for the consumer to customize the content that will be shown. For example, at the end of a Facebook post the consumer may be asked to "See More

Content Like This” or “Less Content Like This” to further refine the search process. Meta has made its Artificial Intelligence models available to the public so that the search process is as transparent as possible. Other corporations that are actively using Artificial Intelligence in their daily operations are Upstart, JP Morgan Chase, Boeing, Johnson and Johnson and Exxon Mobil. Going forward, Artificial Intelligence technology is likely to continue improving very rapidly and will soon become a major component of many business applications, touching every aspect of people’s lives.

Challenges in Starting up a New Business

There are many challenges in starting up any new business. Among these is being able to identify the target market for the products that would be sold by the new company. It is also important to be able to determine how the new business’s products are different from existing products so that they can be marketed properly.

Obtaining funding is a critical consideration for any new business. This funding can initially come from the entrepreneur and possibly friends and family members. As the business expands, more funding may be obtained from “Angel” investors who provide substantial funding in exchange for partial ownership of the new company. When these funds are no longer sufficient to fuel a company’s growth, it can incorporate and issue shares of stocks (i.e., “go public.”)

Convincing investors to fund a new enterprise is a major challenge for any business organization. Investors must be convinced that the business has a strong plan for the future, marketable products that can be produced at a relatively low cost with a strong demand for the products that are likely to grow in the future. In addition, the product should be one that is not easy for competitors to replicate.

Closely related to the challenge of obtaining funding is the need for a long-range financial plan which specifies forecasted revenues, expenses, market demand, etc. so that the company can adequately plan for the future. Decisions must be made about expanding the current operations, hiring new employees, obtaining new resources, etc. Obtaining funding can be a very time-consuming process; it is vitally important to know in advance how much funding will be needed in the immediate future.

For any new business one of the major challenges will always be finding the right employees. They need to have the right skill set and a positive attitude toward work and be willing to work long hours at a potentially low salary in exchange for the promise of much higher incomes in the future. Often entrepreneurs work a huge number of hours when they start up their businesses but eventually will need to hire employees to help expand the company. Hiring the right employees is challenging but necessary as the employees can make or break a new organization.

A new business also must comply with many requirements such as following tax laws, obeying legal regulations, complying with environmental rules, etc. These areas often require

specialized expertise that must be hired in-house or else obtained from outside firms, often at great expense.

Once a new company has been established, it must find a way to promote its products and increase brand awareness through marketing. For example, soon after Jeff Bezos founded a company called “Cadabra” in which he sold books out of his garage, he changed the name to “Amazon” and began marketing books and videos online. By 1995 Amazon was available on the internet and was one of the very first online retail companies. Amazon made its reputation with its huge selection of books and accompanying reviews and recommendations that made it easy for customers to search for books that they were interested in. Gradually, Amazon offered other products and eventually began using its own shipping services.

Advertising a new company’s products can be done in numerous ways. The company can use traditional methods such as advertising in newspapers and magazines or on TV. Most businesses also have websites which can be used to promote and sell their products. Ads can be placed on other websites as well to maximize brand recognition to the public. Ads can also be placed with smartphone apps such as Instagram. For example, Barnes and Noble continues to run “bricks-and-mortar” stores but also has a website on which customers can buy books or other products. Barnes and Noble also has its own reader, known as the Nook, which competes with Amazon’s Kindle.

Another of Amazon’s major competitors, Walmart, eventually added a website which allows customers to order products online. In addition, Walmart has come up with ways to distinguish itself from Amazon, such as simplifying its online return policy, which makes it easier for customers to exchange products and/or obtain refunds. Walmart has also promoted the idea that unlike Amazon, which requires membership in Amazon Prime to take advantage of some Amazon services, Walmart does not require any memberships. Walmart built its reputation on offering the lowest possible prices for a huge variety of products; it is now attempting to diversify into more upscale merchandise to attract more customers.

Challenges Unique to Starting up a New Artificial Intelligence Business

Due to the ferocious competition in the area of Artificial Intelligence, an entrepreneur hoping to break into this industry can do so in a few different ways. One is to create new technologies or find new applications of existing Artificial Intelligence methods. This option requires a great deal of technological expertise and would entail a large opportunity cost in the form of the large salaries that could be earned by working for Google, Apple, Amazon, etc. Another path available to the entrepreneur is to offer customized services to smaller companies that are unable to develop their own Artificial Intelligence services or else cannot afford those offered by larger corporations such as Google and Amazon. The entrepreneur could offer Artificial Intelligence services that are customized to the needs of the individual company, helping them maintain and utilize AI systems. The entrepreneur would need to be extremely flexible and ready to produce a wide variety of different types of software and other services. The entrepreneur would face many challenges specific to the industry, such as:

1) Creating Artificial Intelligence services that are not being offered by major competitors (Amazon's Anthropic, Google's Gemini, Elon Musk's Xai, Microsoft's OpenAI, etc.) This would include customized services that could be provided more easily by a small startup than one of the large competitors. Another possibility is to find specialized areas that will be affected by the rise of Artificial Intelligence, such as legal services, financial services, accounting services, and develop customized services in these areas.

2) Anticipating the future direction of this market and taking steps to be able to provide the newest services as market demand evolves. Technological progress in this market is extremely rapid, with enormous quantities of resources being dedicated to the advancement of this field by companies such as Apple, Amazon and Google. Competition in this field is likely to become more intense in the future due to the large potential revenues from this market. Keeping up with the latest developments and being able to anticipate the future demand for Artificial Intelligence-related products is critical for the long-run survival of any company in this industry.

3) Recruiting enough talented programmers, software engineers, artificial intelligence specialists, etc. to be able to provide marketable services to potential customers. The supply of people with these backgrounds is likely to be very small compared with the demand, so that the salaries needed to attract these people are likely to be extremely high. The salaries offered by large companies such as Amazon, Google, etc. are likely to be quite large, putting owners of small companies at a significant disadvantage. Small companies can respond by offering perks such as tuition reimbursement or opportunities for rapid career growth, as well as profit-sharing and other benefits.

4) Standing out from the competition would be a major challenge as the field is likely to attract progressively more firms seeking to profit from the Artificial Intelligence boom. The number of businesses providing Artificial Intelligence services has grown dramatically in the past few years. This is evidenced by the fact that from January 2024 to October 2024 39 new Artificial Intelligence companies each raised \$100 million or more to expand their operations. Overall, this represents a total of 28% of all venture capital raised in 2024 to date. Among these companies is xAi, an Artificial Intelligence company owned by Elon Musk, which raised \$6 billion on May 31.

Conclusion

The field of Artificial Intelligence is growing extremely rapidly. Revenues from Artificial Intelligence products and services is estimated to be about \$200 billion in 2024. This is expected to grow extremely rapidly in the next few years, potentially reaching \$1.3 trillion by 2030 according to Forbes. Further, this growth is expected to expand the size of U.S. Gross Domestic Product by 21% as of 2030, leading to huge increases in standards of living. The popularity of Artificial Intelligence products is shown by the fact that there were one million new

users of ChatGPT within a week of its initial release. In the automotive field, Artificial Intelligence will lead to the creation of more technologically sophisticated cars, including the widespread use of Robotaxis. The introduction of Optimus robots by Tesla to the consumer market could trigger advancements in many different fields, leading to opportunities for entrepreneurs in every area. According to Forbes, 64% of business owners expect to use Artificial Intelligence methods in the future to increase their productivity. Although Artificial Intelligence has the potential to vastly improve the quality of life in the future, there are some concerns common to all new technologies, such as the displacement of jobs and entire industries. This process was referred to as “creative destruction” by the economist Joseph Schumpeter. The massive growth that is likely to result from increased usage of Artificial Intelligence parallels other periods in U.S. history where rapid advances in technology had a profound impact on the U.S. economy, such as during the “Gilded Age” in the late 19th Century. These developments create opportunities for many new entrepreneurs to contribute to the growing number of products and services that will be in demand in the future. Finding a niche in this market has the potential to generate huge profits for successful entrepreneurs. The challenge is to identify the right opportunities and be in a position to exploit these opportunities with the right ideas, resources and hard work.

Advancements in Customer Churn Prediction: A Review of Machine Learning Techniques and Integrating ChatGPT for Personalized Customer Retention Strategies and ChatGPT for Personalized Customer Retention Strategies By Jingyi Xiao

Abstract

This paper brings together insights from multiple studies, each addressing the crucial issue of customer churn prediction in the telecommunications industry. Retaining existing customers is considerably more cost-effective than acquiring new ones, making accurate prediction methods essential for maintaining profitability. This comprehensive literature review carefully examines eight significant studies that apply different machine learning techniques to enhance the precision of churn forecasts. It covers the types of models used, the metrics for evaluating their effectiveness, and concludes with my perspectives on potential research paths that could be explored in the future to continue improving churn prediction strategies.

Keywords: Customer churn, Customer retention, ChatGPT, Data analysis, Churn prediction models

Introduction

Customer churn, where customers cease their business relations, significantly impacts profitability, especially in sectors like telecommunications, finance, and subscription-based services. The cost implications of customer churn are substantial, as acquiring new customers can be 5 to 25 times more expensive than retaining existing ones. For instance, Fred Reichheld, the founder of the NPS score system, found that if you retain just 5% of your customers, it results in at least 25% higher profits in the long run (Hyken) [1]. Research by Bain & Company also highlights that a 5% increase in customer retention can lead to a profit increase of 25% to 95% across various industries ("Churn Analysis: Strategies for Customer Retention") [2]. Effective churn prediction models are therefore essential for maintaining a stable customer base and ensuring long-term success. By identifying customers who are likely to churn, businesses can actively engage with them through personalized retention strategies while being cost-effective and enhancing customer satisfaction. Traditional churn prediction methods primarily rely on statistical analysis tools and rule-based systems. These methods involve analyzing customer data to identify patterns and trends associated with churn. Common techniques used include logistic regression and decision trees. For example, a study by Verbeke et al. [3] used logistic regression and decision trees to predict churn in the telecommunications field and achieved reasonable accuracy in identifying potential churners. However, traditional methods have certain limitations as they struggle to handle large and complex datasets which can lead to less accurate predictions. Additionally, these methods are usually based on predefined rules and assumptions, which may not capture the dynamic nature of customer behavior. Machine Learning (ML) offers a better and more refined approach to churn prediction. It can process greater amounts of data and detect complex relationships that might not be seen through statistical analysis alone. Using techniques

such as random forests, support vector machines, and neural networks to churn prediction, have resulted in greater accuracy and performance. For instance, Verbeke et al. [3] showed that ensemble learning techniques, such as random forests, outperformed traditional models in identifying churn in the telecommunications industry. However, despite their advantages, ML models often provide a lack of strategies for retention that consider the unique preferences and needs of each customer. While these models are great at identifying potential churners, businesses still face the challenge of determining the best way to retain these customers. Advanced technologies like ChatGPT offer promising solutions to bridge the gap between churn prediction and customer retention strategies. By using ChatGPT's abilities, businesses can suggest customized interaction strategies that enhance both customer engagement and loyalty. Different from traditional ML models, which focus primarily on prediction, ChatGPT can generate personalized communication strategies tailored to each individual customer. This research aims to fill this gap by leveraging ChatGPT's generative capabilities to suggest customized interaction strategies that enhance customer engagement and loyalty. This literature review examines three key areas: churn prediction models, customer retention strategies, and the integration of AI in decision support systems.

Related Works

Lalwani et al. [4] addresses the challenge of predicting customer churn in the telecommunications industry by using machine learning techniques. The primary contributions include the use of a gravitational search algorithm (GSA) for feature selection, which effectively reduces the dataset dimensions and improves prediction accuracy. The methodology involves six steps: data preprocessing, feature analysis, feature selection with GSA, data splitting into training and testing sets, application of various machine learning models, and the use of boosting and ensemble techniques. Lalwani et al. [4] notes that while regression analysis is generally not used extensively for customer churn prediction, Logistic Regression can be effective when used properly. Logistic Regression achieved an accuracy of 80.45%, a recall of 80.23%, a precision of 79.11%, an F-measure of 78.89%, and an AUC score of 82%. The study compares Logistic Regression with other models such as Decision Trees, Random Forests, Naive Bayes, and various boosting algorithms. It indicates that Logistic Regression performs reasonably well, but models like Adaboost and XGBoost classifiers outperform Logistic Regression in terms of AUC score, achieving 84%. Adaboost combines multiple weak learners to form a strong classifier which enhances performance but can be sensitive to outliers. XGBoost is known for its high efficiency and performance in handling large datasets, but it can be sensitive to outliers, can overfit the training data, and can be difficult to interpret compared to simpler models like logistic regression.

Tsai and Lu [5] focuses on enhancing customer churn prediction models by utilizing hybrid data mining techniques. The study developed two hybrid models: SOM + ANN (Self-Organizing Maps combined with Artificial Neural Networks) and ANN + ANN (two combined ANN models). These hybrids aim to improve prediction accuracy over single-method

models. The methodology involves preprocessing data through clustering (SOM) and then applying classification techniques (ANN) for prediction. Evaluations were conducted using prediction accuracy metrics and Type I and II error rates, with results indicating that the ANN + ANN model outperformed both the SOM + ANN hybrid and the single ANN baseline model. The ANN+ANN model significantly enhances the accuracy and reliability of churn prediction, which is important for effective customer retention strategies. The use of AI in decision support systems allows businesses to make informed, proactive decisions that can improve customer retention and overall business performance. The best evaluation metrics should focus on both overall performance and the ability to accurately identify customer churn. Accuracy provides a general measure of how often the model's predictions are correct. However, given the importance of identifying churners correctly, precision and recall are crucial. Precision measures the proportion of true positive churn predictions out of all positive predictions which minimizes false positives and recall measures the proportion of actual churners correctly identified.

Ahmad et al. [6] presents a study on customer churn prediction in the telecommunications industry, using machine learning techniques within a big data framework. They highlight the goal of developing an effective predictive model for identifying customers likely to leave, focusing on SyriaTel. Their study employs various machine learning algorithms, including Decision Tree, Random Forest, Gradient Boosted Machine Tree, and Extreme Gradient Boosting (XGBOOST), with XGBOOST achieving the best results of an AUC value of 93.301%, followed by GBM, Random Forest, and Decision Tree. Their model also uses Social Network Analysis (SNA) features, significantly enhancing its performance. Their study addresses challenges like data imbalance and missing values, leveraging feature engineering to enhance model accuracy. Their study concluded that by incorporating SNA features and utilizing a big data platform significantly improve the predictive accuracy of churn models, providing valuable insights for better customer retention strategies.

Vafeiadis et al. [7] employed various machine learning techniques for predicting customer churn in the telecommunications industry. Their study evaluates the performance of five widely used classification methods: Artificial Neural Networks (ANN), Support Vector Machines (SVM), Decision Trees (DT), Naïve Bayes (NB), and Logistic Regression (LR). The performance of these methods is assessed using cross-validation on a public dataset from the UCI Machine Learning Repository. Also, their study explores the impact of boosting algorithms on these models, using AdaBoost. The results indicate that boosting significantly improves the performance of the classifiers, with the SVM-POLY model combined with AdaBoost achieving the highest accuracy of about 97% and an F-measure of over 84%. Vafeiadis et al. [4] concluded that boosting algorithms can highly improve the predictive power of standard machine learning models, making them more suitable for practical applications in customer retention strategies.

Çelik and Usume [8] employed different machine learning techniques for predicting customer churn, focusing on the importance of retaining existing customers due to the high costs associated with acquiring new ones. They highlight the use of different algorithms, including artificial neural networks (ANN), decision trees, support vector machines (SVM), naive Bayes,

k-nearest neighbors (k-NN), and extreme gradient boosting (XGBoost). They also explore the Cox proportional hazards model and deep learning methods, highlighting that deep learning techniques can achieve higher accuracy in complex scenarios but are still new and sometimes unstable. Çelik and Usame [5] concluded that deep learning can model complex systems and achieve high success rates. However, it's new and sometimes unstable, so machine learning is a good alternative, especially for predicting events like customer churn. To improve accuracy, the data set should be balanced, large, free of systematic errors, and have clear explanations of the variables. The Cox regression model is effective for predicting factors affecting time-related outcomes, like life expectancy and risk groups.

Rahman and Kumar [9] evaluated multiple classification algorithms (KNN, SVM, Decision Tree, and Random Forest), and the application of feature selection techniques (mRMR and Relief) to enhance model performance. Their methods involved preprocessing data, oversampling to address class imbalance, applying feature selection, and evaluating classifiers using accuracy and cross-validation. Their paper mentioned that the results are compared to find an appropriate model with higher precision and predictability. Random Forest generally outperformed other classifiers, particularly after oversampling, and that feature selection had varied impacts on different classifiers' accuracy. The paper could benefit from a more detailed presentation of evaluation metrics beyond accuracy, such as precision, recall, F1-score, and AUC, to provide a comprehensive understanding of each model's performance. Utilizing a larger and more diverse dataset could also improve the generalizability of the findings. The current dataset is from Kaggle with 10,000 entries, which might not capture the variability found in different banking environments. This paper aims to improve the prediction of customer churn in banking.

Lemos et al. [10] investigate customer churn prediction by developing a robust predictive model for customer churn, comparing different feature selection methods, and assessing their impact on model performance. Their study utilized a dataset with 35 attributes from 500,000 current account clients, using oversampling to balance the class distribution. Their methodology involved preprocessing the data, applying feature selection techniques such as mRMR and Relief, and using classifiers like KNN, SVM, Decision Tree, and Random Forest. Key findings show that feature selection methods can enhance classification accuracy, with specific attributes like the number of products, age, and balance being particularly predictive. Their study highlights the importance of feature selection and model optimization in improving predictive performance in customer churn analysis.

AL-Najjar et al. [11] created a predictive model for credit card customer churn using feature selection methods and five machine learning models. They evaluated the performance of various machine learning models and identified the most significant variables for churn prediction. The methods involve selecting independent variables through all-variable selection, two-step clustering, k-nearest neighbor, and feature selection. The models used are Bayesian network, C5 tree, CHAID tree, classification and regression tree, and a neural network. The analysis showed that the C5 tree model performed best, with significant variables being the total

transaction count, total revolving balance, and change in transaction count. Merging multi-categorical variables into one improved the prediction models' performance. One area for improvement in the studies is the validation process. The validation dataset did not always enhance the performance of the models, indicating a need for better validation techniques. Additionally, while the C5 tree model showed high performance, the studies could benefit from exploring ensemble methods that combine multiple models to potentially increase predictive accuracy even more.

Algorithms

Machine learning algorithms are divided mainly into supervised learning, unsupervised learning and reinforcement learning. In supervised learning the model is trained with labeled data whereas in unsupervised learning, training is done without labeled data. Reinforcement learning is a method of learning from experience. The model learns from the rewards it receives from the steps it took last time. Customer churn prediction is a supervised classification model. In classification models, data is classified into one of the specified classes. Here, each data is classified either as churn or non-churn. There are various classification algorithms used for this. Those of which discussed in the reviewed papers are discussed here.

Logistic Regression

This algorithm estimates discrete values (0 or 1) based on a given set of an independent variable(s). It basically predicts the probability of occurrence of an event by fitting data to a logit function. For customer churn prediction, logistic regression can estimate the probability of a customer leaving the company, or churning, based on one or more predictor variables. It assumes a linear relationship between the input features and outputs, which makes it simple. The model uses a logistic function to make the output into a range between 0 and 1, making it suitable for predicting probabilities. However, logistic regression is mainly effective for churn prediction when the relationship between features and variables are approximately linear. Its simplicity does not account for interactions between features, influenced by complex variables. For customer churn prediction, the data needs to be properly transformed and preprocessed to achieve good performance. It is also sensitive to outliers in the data and struggles with high-dimensional data.

Support Vector Machine

In SVM, each data item is plotted as a point in n-dimensional space (where n is the number of features you have) with the value of each feature being the value of a particular coordinate. Then, we perform classification by finding the hyper-plane that differentiates the two classes very well. What the support vector machine is trying to do is, it divides the prediction into two parts +1 that is the right side of the hyperplane and -1 that is the left side of the hyperplane. The Support Vector machine provides higher accuracy than Naïve Bayes and Logistic Regression.

Naïve Byes

It is a classification algorithm derived from Bayesian Theorem of classification which is used with high dimensional data. Naive Bayesian classifiers assume that the value of each feature has an independent influence on a given class, and this assumption is called class conditional independence that is used to simplify the computation. In simple terms, this classifier assumes that the presence of a feature vector (customer churn) is independent from the other feature vectors that are present in the class.

$$P(A | B) = \frac{P(B | A) \cdot P(A)}{P(B)}$$

Decision Tree

It is a classification algorithm that models data into a tree structure by dividing data into smaller subsets and forms a final tree with decision nodes and leaf nodes. This method recursively divides the dataset to make decisions, making the model easy to interpret and capable of handling both numerical and categorical data. Despite these strengths, decision trees are prone to overfitting, especially with deep trees and noisy data, which can limit their generalization capability.

Random Forest

It is a combination of many decision trees, where each tree takes a different feature set and the prediction is based on the majority vote from all the uncorrelated trees. This approach uses the power of multiple models to improve overall accuracy which reduces the risk of overfitting that is common with single decision trees. It then combines the results of all these trees to make a final prediction. RF is particularly powerful in handling high-dimensional data and capturing complex, non-linear relationships between features. Random Forests provide valuable insights into feature importance, helping to identify which attributes most significantly impact predictions. In customer churn prediction, RF often outperforms simpler models like LR due to its ability to model intricate patterns in the data

Bagging Algorithms

It is an ensemble learning method that trains several models independently on random subsets of the data and then combines their predictions to make a final decision.

Boosting Algorithms

Boosting algorithms combine multiple weak learners or simple models in a sequential method, each time focusing on fixing the errors of the previous models. This method helps to reduce high bias.

Comparisons

It is important to recognize the similarities and differences in all of these algorithms. All of the models have the goal to classify data, but they do so using different methods and

assumptions. Logistic regression and Naïve Bayes are relatively simple models that assume linear relationships or feature independence, making them easy to use, but can be limited by their assumptions. Conversely, SVM is a more complex model that works well in high-dimensional spaces and with non-linear relationships. However, it requires precise adjustments and can be difficult to use. Decision trees can provide a straightforward and interpretable approach by slipping data into subsets, but overfitting can be a downside. Random forests address this issue by combining multiple decision trees which can improve accuracy.

Performance Measures

1. True Positive (T_p) is an outcome where the model correctly predicts the positive class.
2. True Negative (T_n) is an outcome where the model correctly predicts the negative class.
3. False Positive (F_p) is an outcome where the model incorrectly predicts the positive class.
4. False Negative (F_n) is an outcome where the model incorrectly predicts the negative class.
5. Accuracy: It is the ratio of the number of correct predictions to the total number of input samples.

$$Accuracy = \frac{(T_p + T_n)}{(T_p + F_p + T_n + F_n)}$$

6. Precision: It is the fraction of relevant instances among the total retrieved instances.

$$Precision = \frac{T_p}{T_p + F_p}$$

7. Recall: It is the fraction of relevant instances retrieved over the total amount of relevant instances.

$$Recall = \frac{T_p}{T_p + F_n}$$

8. F Score (F-measure) : It is the weighted harmonic mean of the test's precision and recall.

$$F - measure = \frac{(2 \times Precision \times Recall)}{(Precision + Recall)}$$

9. ROC Curve: It is a graph showing the performance of a classification model at all classification thresholds by plotting parameters such True Positive Rate and False Positive Rate.
10. AUC Curve: It measures the entire two-dimensional area underneath the entire ROC curve and provides a cumulative measure of performance across all possible classification thresholds.
11. Confusion Matrix: A matrix that summarizes the performance of a machine learning model on a set of test data. It is a means of displaying numbers of accurate and inaccurate instances from the model's predictions. It consists of four essential components: True Positive (T_p), False Positive (F_p), True Negative (T_n), and False Negative (F_n).

12. Error rate: The inaccuracy of predicted output values of categorical target values.
13. Specificity: It is the proportion of actual negatives which are predicted as true negative.
14. Sensitivity: It is the proportion of actual positives which are predicted as true positives.

Discussion

When comparing models like logistic regression, support vector machines (SVM), Naïve Bayes, decision trees, random forests, bagging, and boosting algorithms, integrating ChatGPT can significantly enhance customer churn prediction. Traditional models, which usually rely on numerical and categorical data, can be combined by ChatGPT's ability to analyze data from customer interactions across various platforms like emails, chatbots, and social media. This integration can allow a deeper understanding of customer opinions, behavior, and intentions, which is vital for improving prediction accuracy. In addition, ChatGPT can create custom responses to specific customer inquiries, which can enhance customer satisfaction and potentially reduce churn. Integrating traditional models and ChatGPT can refine churn models while also offering more accurate predictions.

However, this integration also raises important ethical considerations, such as privacy concerns, transparency in data usage, and the authenticity of AI-driven interactions. Balancing AI's abilities with ethical standards is crucial to maintain customer trust and make sure companies are compliant with regulations. Additionally, ChatGPT collaboration with human agents to provide a more effective customer support experience is important. While AI can handle basic questions, more complicated issues might still require human intervention. To improve customer experiences, the most efficient way is to work together with AI and humans.

Conclusion

Customer churn prediction is an ongoing challenge, where retaining customers is significantly more cost-effective than acquiring new ones. Through the comprehensive review of various machine learning models, including logistic regression, decision trees, support vector machines, random forests, and ensemble methods such as bagging and boosting, it is clear that no single model can universally outperform others across all instances. However, through ensemble techniques like random forests and boosting, there seems to be higher accuracy in handling complex, high-dimensional data.

The reviewed studies highlight the importance of selecting the right model based on the specific characteristics of the dataset and the business context. Advanced models, while more powerful, can be sensitive to overfitting and require careful adjustments. The integration of feature selection methods, as seen in some studies, can further enhance the accuracy and clarity of these models, highlighting the need for a balanced approach that considers both performance and practical applicability.

Future research should focus on addressing the limitations of current models, such as their comprehensibility and sensitivity to noisy data. Additionally, there is a growing potential in leveraging inventive AI models like ChatGPT to not only predict churn but also suggest

personalized and unique retention strategies. This integration could link together churn prediction and useful strategies, allowing businesses to implement more targeted and effective customer retention efforts.

As the field continues to evolve, the combination of traditional machine learning techniques with new AI tools holds promise for advancing customer churn prediction and retention strategies. By continuing to explore these approaches, businesses can better anticipate customer behavior, reduce churn rates, and ultimately achieve greater long-term profitability.

Exploring the Bidirectional Impact of COVID-19 and Childhood Obesity

By Yash Garg

Abstract

The COVID-19 pandemic affected the lives and routines of many children across the United States. Health measures implemented by the Centers for Disease Control and Prevention (CDC) such as the quarantine requirements and social distancing, though necessary, resulted in reducing physical activity and increasing screen time which in turn likely disrupted sleep patterns and increased anxiety among families. Simultaneously, childhood obesity, linked to comorbidities such as diabetes, chronic inflammation, and respiratory problems like severe asthma, became more prevalent. These comorbidities of childhood obesity can influence the severity of COVID-19 symptoms and the disease itself. This study was conducted to evaluate the connection and impact that COVID-19 and childhood obesity had on children. A data analysis was conducted with the National Health Interview Survey (NHIS) datasets for 2020 and 2022. It did not show a bidirectional impact between COVID-19 and childhood obesity. However, it did show a positive correlation between the variables of interest. This was accomplished with descriptive statistics and a bivariate analysis. A logistical analysis was excluded due to the insignificant p value between COVID-19 and childhood obesity as measured by BMI. The study demonstrated a relationship between intermediary variables to both COVID-19 and childhood obesity. Both pandemics had variables that affected them individually. Thus, while there was no direct impact seen between COVID-19 and childhood obesity, the two pandemics both affect and are likely affected by common variables.

Keywords: COVID-19, Childhood obesity, Bidirectional Impact

Introduction

COVID-19 is a contagious disease and national threat caused by the SARS-CoV-2 virus. It affected children across the United States by inhibiting physical activity due to lockdown restrictions and school closures. Health measures implemented by the Centers for Disease Control and Prevention (CDC) such as the quarantine requirements and social distancing, though necessary, resulted in reducing physical activity and increasing screen time which in turn likely disrupted sleep patterns and increased anxiety among families. [3], [4], [7], [8], [9], [10], [11], [16] In fact, according to reports, there may have been an 0.85 percentage increase in childhood obesity that could potentially amount to a 5.1% increase throughout the lockdown period. [4] Obesity/overweight is defined as greater than 85 percentile of body mass index (BMI) in the age group being considered. Due to increased screen-time, disrupted sleep patterns, and increased mental health problems, namely anxiety and depression, childhood obesity rates rose. [3], [4], [7], [8], [9], [10], [11], [16] In 2019, the childhood obesity/overweight rate was 31.2%. It jumped to 33.1% and 33.9% in 2020 and 2021, respectively.[15]

Childhood obesity rates worsened throughout the COVID-19 pandemic. Childhood obesity can lead to many other conditions and health risks. These comorbidities are diabetes, chronic inflammation, and respiratory problems like severe asthma and can influence the severity of COVID-19 symptoms and the disease itself. [4], [5], [7], [10], [11], [12], [14] [6] For example, severe asthma and diabetes make the immune system weaker allowing symptoms of COVID-19 to become more severe among children. [4], [5], [7], [10], [11], [12], [14], [6] This, in turn, increased the risk of obese children contracting a more severe form of COVID-19. [4], [5], [12], [14], [6]

How the COVID-19 lockdown influenced childhood obesity

The quarantine lockdown resulted in creating an environment where childhood obesity could thrive as a result of the limitations of the lockdown like the loss of in-person schooling and related activities. The literature suggested that “the loss of schooling was a critical consequence as school health activities like oral health check-ups, vision screening, growth monitoring and health/nutrition education were disrupted.”[3] Such changes likely contributed to the rise of childhood obesity during the COVID-19 pandemic.

The loss of physical activity was a critical consequence of school closures during the COVID-19 lockdown as children lost access to Physical Education (PE) classes, in-school sports, or any other extracurricular activity performed outside of their homes. [3] Since children’s physical activity was lost, their lifestyle at home became more sedentary and likely contributed to the rise of childhood obesity. Due to the addition of virtual schooling and increased time available because of the loss of activities, children’s screen time also rose. The online learning, overuse of computers, and internet was a direct result of a loss of schooling. [3] This likely contributed to weight gain. In addition, a significant increase in sedentary lifestyle and leisure screen time during the lockdown has been connected to increased depressive and anxiety symptoms. [2]

Screen time resulted in the increased consumption of high caloric meals, snacks, and beverages as past literature indicated. [11] By closing schools during the pandemic, children had increased access to unhealthy snacks, and less consistent access to appropriately portioned meals through school. [9] It was noted that there was a 50% increase in the consumption of high caloric snacks and beverages during the pandemic. [11] Without healthy and consistent food options, changes in diet could be a large contributor to the rise of childhood obesity during the lockdown. [9]

COVID-19’s impact not only affected the physical lives of children, but also their psychological state. [1], [2] Some negative effects of mental health status are risk factors for several chronic conditions such as obesity, diabetes, and cardiometabolic diseases. [1], [2] Furthermore, reduced physical activity, increased screen time, and increased sedentary behavior are related to these conditions. [1], [2] According to Alves and Yunker, some children reported approximating 11 hours of screen time which caused adverse effects on their mental health status, implying depression.[1], [2] Most importantly, “anxiety scores were increased by more

than 5 standard deviations greater than values from healthy pediatric populations prior to the pandemic.” [1], [2] Furthermore, American adults said that the pandemic significantly affected their mental well-being. [1], [2]

Lastly, the COVID-19 lockdown disrupted children’s sleep patterns possibly because of virtual schooling, increased screen time, and other factors. The lockdown was associated with sleep disorders in children and adolescents which can contribute to the rise of childhood obesity. [14], [10]

How childhood obesity impacts the COVID-19 virus symptoms

Being obese has effects and comorbidities which can, in turn, allow COVID-19 to become more severe. As such, it can affect the immune system allowing for an increased risk of worsening COVID symptoms, posing a greater health risk. Some comorbidities are asthma, malignancies, anemia, diabetes, chronic inflammation, cardiovascular diseases, sleep disorders, and more. [4] These effects may have caused COVID-19 to take a more severe form. [4] This, in turn, led to worse outcomes for obese patients diagnosed with COVID as their rates of hospitalization and the need for invasive mechanical intervention (IMV) increased. [4] Moreover, “normal respiratory physiology is usually impaired in obese patients” which can then lead to a more acute form of COVID. [4] Diabetes is a large contributor to impairing the immune system as it can increase the severity of COVID infections through the impairment of the beta cells within the immune system. [14] In younger children, this can lead to more health risks and it can make COVID-19 more severe. [14]

Below is my current working framework based on the above analysis.

This framework demonstrates the bidirectional impact between the two pandemics: childhood obesity and COVID-19. This impact of COVID-19 on childhood obesity is shown the most through the COVID-19 lockdown restrictions which created an environment that allowed childhood obesity to thrive. Inversely, childhood obesity mainly impacts COVID-19 by affecting vital organs like the immune system through factors like diabetes, respiratory system failure, or other diseases. [4], [14] COVID-19 not only can affect an obese person more, it can pose a much higher health risk as the obese person's immune system is no longer as strong. As a result, an obese person's chances of hospitalization increases and their need for Initiating Mechanical Ventilation (IMV) also increases. [4] This can significantly impact their chances of recovery.

Methodology

Literature Review

To begin, a literature search using PubMed was conducted using the following keywords: COVID-19, Obesity, and Health Policy which resulted in 469 articles. To further narrow this search, the following keywords were used: COVID-19, Childhood Obesity, and Bidirectional Impact resulting in two articles. References of these articles were also used to find relevant literature on COVID-19, Childhood Obesity and their bidirectional impact. This resulted in 12 articles being chosen as references.

Data

This study used the National Health Interview Survey (NHIS) for 2020 and 2022 because those years contained data for the variables of interest. The year 2021 did not have BMI data, and thus was excluded. Multiple years were analyzed in order to evaluate the trend of the bidirectional impact between COVID-19 and childhood obesity. The statistical data analysis was done using the Stata 18 software analysis program.

The NHIS is a cross-sectional form of data collection on the United States population [13] which is part of the CDC. [10] The purpose of the NHIS is to gather data and statistics on the health of the American population. [13] The NHIS dataset is compiled through the data gathered during the year by interviewers such as the census interviewers. [13] The population that the NHIS represents include the civilian noninstitutionalized population such as households, shelters, and group homes. [13] It excludes active military personnel, homeless individuals, American citizens who do not live in America, etc. [13]

This data's study population includes children ages 10-17 for BMI/weight. It also includes the variables chosen to be studied for different ethnicities. Ages were 0-17 for these variables, and different ethnicities were evaluated such as Hispanic, Non-Hispanic White only, Non-Hispanic Black/African American only, Non-Hispanic Asian only, etc. [13] This dataset reflects the United States population during the chosen years of 2020 and 2022.

Characteristics	2020		2022	
	N	%	N	%
Sex				
Male	2966	51.23 %	3858	51.69 %
Female	2820	48.70 %	3603	48.27 %
Age				
<1 years of age	304	5.25 %	417	5.59 %
1-17 years of age	5486	94.75 %	7047	94.41 %
Race				
Hispanic	1348	23.28 %	1967	26.35 %
NH White	3153	54.46 %	3677	49.26 %

Obese	430	14.76	587	16.61 %
Missing	3084		4172	

Results and Analysis

The NHIS, a major data collection program of the National Center for Health Statistics (NCHS) was used for the data analysis. [13] In this data analysis, the datasets for 2020 and 2022 were used. These years were chosen due to the presence of BMI variables in the dataset. Originally, the 2021 and 2023 datasets were also considered, however, these datasets do not

contain the necessary BMI or WEIGHT and HEIGHT variables (which could have been used to calculate BMI) and therefore, those years were excluded.

The data analysis was conducted to evaluate the relationship or correlation between the two pandemics: COVID-19 and childhood obesity. Using variables affecting both pandemics, the analysis was done in order to see if there was a “bidirectional impact” or not. This was done with descriptive statistics and bivariate analysis. A logistical analysis was excluded due to the insignificant p value of COVID-19 and BMI. Based on our results, there was no significant bidirectional impact seen between COVID-19 and childhood obesity. Although the data analysis did not show a bidirectional impact, it demonstrated a relationship between intermediary variables to both COVID-19 and childhood obesity (Tables 1-4). Both pandemics have variables that affect them individually. Thus, while there was no direct impact seen between COVID-19 and childhood obesity, the two pandemics both affect and are likely affected by common variables (Tables 1-4).

Table 1: BMI, COVID, and Variables of Interest from 2020 NHIS

Variable 1	Variable 2	P-Value
BMI	Ever Had COVID-19	0.304
BMI	SOCIODEMOGRAPHIC FACTORS	
BMI	Race	0.000*
BMI	Sex	0.010*
BMI	Age	0.000*
BMI	COMORBID CONDITIONS	
BMI	Ever Had Asthma	0.001*
BMI	Ever Had Diabetes	0.199
BMI	MENTAL HEALTH	
BMI	Took Meds for Mental Health Problems	0.002*
BMI	Frequency of Seeming Sad or Depressed	0.023*
BMI	How Often Seems Anxious, Nervous, or Worried	0.111
BMI	SLEEP PATTERNS	
BMI	Frequency of Regular Bedtime During School/Week Nights	0.042*
BMI	Frequency of Regular Wake Time During School Days	0.223
BMI	Frequency of Napping and Falling Asleep During the Day	0.152

BMI	Frequency of Difficulty of Getting Out of Bed	0.020*
BMI	Frequency of Being Well-Rested	0.086
BMI	PHYSICAL ACTIVITY	
BMI	Attends PE Class	0.029*
BMI	Participates in Sports Team in the Past 12 Months	0.000*
BMI	SCREEN TIME	
BMI	Child Gets 2+ Hours Screen Time Daily	0.476

*(bold and asterisk) identifies significant variables with p-value less than 0.05

Table 1 shows the results of the data analysis in terms of BMI in 2020 and the correlation of the chosen variables. As described earlier, BMI and COVID showed no significant relationship as seen with “Ever had COVID-19 for 2020.” However, BMI in 2020 did have a significant relationship with socio-demographic factors like Race, Sex, and Age. With respect to co-morbid conditions, though it was correlated with Asthma, BMI was not significant with Diabetes in 2020. For mental health, BMI-2020 was significant with “Took Meds for Mental Health Problems” and “Frequency of Seeming Sad or Depressed,” but not with “How Often Seems Anxious, Nervous, or Worried.” In the category of sleep patterns, BMI-2020 was significantly correlated with “Frequency of Regular Bedtime During School/Week Nights” and “Frequency of Difficulty of Getting Out of Bed,” but “Frequency of Napping and Falling Asleep During the Day,” “Frequency of Being Well-Rested” and “Frequency of Regular Wake time During School Days” were not significant. For physical activity, BMI-2020 had a significant relationship with both “Attends PE Class” and “Participates in Sports Team in the Past 12 Month.” However, BMI-2020 was not correlated with “Child Gets 2+ Hours Screen Time Daily.”

Table 2: COVID, BMI, and variables of interest from 2020 NHIS

Variable 1	Variable 2	P-Value
COVID	BMI	0.304
COVID	SOCIODEMOGRAPHIC FACTORS	
COVID	Race	0.920
COVID	Sex	0.077
COVID	Age	0.860
COVID	COMORBID CONDITIONS	
COVID	Ever Had Asthma	0.992

COVID	Ever Had Diabetes	0.686
COVID	MENTAL HEALTH	
COVID	Took Meds for Mental Health Problems	0.787
COVID	Frequency of Seeming Sad or Depressed	0.051
BMI	How Often Seems Anxious, Nervous, or Worried	0.734
COVID	SLEEP PATTERNS	
COVID	Frequency of Regular Bedtime During School/Week Nights	0.050*
COVID	Frequency of Regular Wake time During School Days	0.036*
COVID	Frequency of Napping and Falling Asleep During the Day	0.309
COVID	Frequency of Difficulty of Getting Out of Bed	0.211
COVID	Frequency of Being Well-Rested	0.444
COVID	PHYSICAL ACTIVITY	
COVID	Attends PE Class	0.186
COVID	Participates in Sports Team in the Past 12 Months	0.838
COVID	SCREEN TIME	
COVID	Child Gets 2+ Hours Screen Time Daily	0.437

*(bold and asterisk) identifies significant variables with p-value less than 0.05

Table 2 shows the results of the data analysis in terms of COVID-19 in 2020 and the correlation of the chosen variables. As described earlier, BMI and COVID showed no significant relationship. COVID in 2020 also did not have a significant relationship with socio-demographic factors like Race, Age and Sex. With respect to co-morbid conditions, COVID was not correlated with Asthma or Diabetes in 2020. For mental health, COVID-2020 was not significant with “Took Meds for Mental Health Problems” and “How Often Seems Anxious, Nervous, or Worried” but had a p- value of 0.051 with “Frequency of Seeming Sad or Depressed.” In the category of sleep patterns, COVID-2020 did not correlate with “Frequency of Being Well-Rested,” “Frequency of Difficulty of Getting Out of Bed,” and “Frequency of Napping and Falling Asleep During the Day,” However, “Frequency of Regular Wake time During School Days” and “Frequency of Regular Bedtime During School/Week Nights” had significant relationship with COVID-2020. For physical activity, COVID-2020 did not have a significant relationship with “Attends PE Class” and “Participates in Sports Team in the Past 12 Months.” There is no significance seen with “Child Gets 2+ Hours Screen Time Daily.”

Table 3: BMI, COVID, and variables of interest for 2022 NHIS

Variable 1	Variable 2	P-Value
BMI	Ever Had COVID-19 for 2022	0.216
BMI	SOCIODEMOGRAPHIC FACTORS	
BMI	Race	0.001*
BMI	Sex	0.000*
BMI	Age	0.000*
BMI	COMORBID CONDITIONS	
BMI	Ever Had Asthma	0.000*
BMI	Ever Had Diabetes	0.018*
BMI	MENTAL HEALTH	
BMI	Took Meds for Mental Health Problems	0.048*
BMI	Frequency of Seeming Sad or Depressed	0.011*
BMI	How Often Seems Anxious, Nervous, or Worried	0.002*
BMI	SLEEP PATTERNS	
BMI	Frequency of Regular Bedtime During School/Week Nights	0.023*
BMI	Frequency of Regular Wake time During School Days	0.001*
BMI	Frequency of Napping and Falling Asleep During the Day	0.018*
BMI	Frequency of Difficulty of Getting Out of Bed	0.468
BMI	Frequency of Being Well-Rested	0.352
BMI	PHYSICAL ACTIVITY	
BMI	Attends PE Class	0.488
BMI	Participates in Sports Team in the Past 12 Months	0.000*
BMI	SCREEN TIME	
BMI	Child Gets 2+ Hours Screen Time Daily	0.325

*(bold and asterisk) identifies significant variables with p-value less than 0.05

Table 3 shows the results of the data analysis in terms of BMI in 2022 and the correlation of the chosen variables. As in previous sections, BMI and COVID showed no significant relationship. However, BMI in 2022 did have a significant relationship with socio-demographic factors like Race, Sex, and Age. With respect to co-morbid conditions, in 2022, BMI was correlated with both Asthma (like in 2020) and Diabetes (unlike in 2020). For mental health, there was a significant correlation seen with both “Took meds for Mental Health problems” and “Frequency of Seeming Sad or Depressed” as in 2020, but unlike 2020, BMI-2022 is also significant with “How Often Seems Anxious, Nervous, or Worried.” In the category of sleep patterns, BMI-2022 did not correlate with “Frequency of Being Well-Rested” and “Frequency of Difficulty of Getting Out of Bed,” but with “Frequency of Napping and Falling Asleep During the Day,” “Frequency of Regular Wake time During School Days” and “Frequency of Regular Bedtime During School/Week Nights.” For physical activity, BMI-2022 had no significant relationship with “Attends PE Class,” but with “Participates in Sports Team in the Past 12 Months, it did.” BMI-2022 was also not correlated with “Child Gets 2+ Hours Screen Time Daily.”

Table 4: COVID, BMI, and the variables of the interest for 2022 NHIS

Variable 1	Variable Labels	P-Value
COVID	BMI	0.216
COVID	SOCIODEMOGRAPHIC FACTORS	
COVID	Race	0.001*
COVID	Sex	0.019*
COVID	Age	0.000*
COVID	COMORBID CONDITIONS	
COVID	Ever Had Asthma	0.000*
COVID	Ever Had Diabetes	0.230
COVID	MENTAL HEALTH	
COVID	Took Meds for Mental Health Problems	0.000*
COVID	Frequency of Seeming Sad or Depressed	0.000*
COVID	How Often Seems Anxious, Nervous, or Worried	0.000*
COVID	SLEEP PATTERNS	

COVID	Frequency of Regular Bedtime During School/Week Nights	0.211
COVID	Frequency of Regular Waketime During School Days	0.784
COVID	Frequency of Napping and Falling Asleep During the Day	0.787
COVID	Frequency of Difficulty of Getting Out of Bed	0.000*
COVID	Frequency of Being Well-Rested	0.001*
COVID	PHYSICAL ACTIVITY	
COVID	Attends PE Class	0.630
COVID	Participates in Sports Team in the Past 12 Months	0.040*
COVID	SCREEN TIME	
COVID	Child Gets 2+ Hours Screen Time Daily	0.003*

*(bold and asterisk) identifies significant variables with p-value less than 0.05

Table 4 shows the results of the data analysis in terms of COVID-19 in 2022 and the correlation of the chosen variables. As described earlier, BMI and COVID showed no significant relationship. COVID in 2022 did have a significant relationship with socio-demographic factors like Race, Sex, and Age. With respect to co-morbid conditions, COVID-2022 was significantly correlated with Asthma but not with Diabetes. For mental health, there was significant correlation seen with “Took meds for Mental Health problems,” “Frequency of Seeming Sad or Depressed” and “How Often Seems Anxious, Nervous, or Worried.” In the category of sleep patterns, COVID-2022 was significantly correlated with “Frequency of Being Well-Rested” and “Frequency of Difficulty of Getting Out of Bed,” but not with “Frequency of Napping and Falling Asleep During the Day,” “Frequency of Regular Bedtime During School/Week Nights” and “Frequency of Regular Wake time During School Days.” For physical activity, COVID-2022 did not have a significant relationship with “Attends PE class” but it did with “Participates in Sports Team in the Past 12 Months.” Unlike in 2020, there is significant relationship seen with “Child Gets 2+ Hours Screen Time Daily” in 2022.

Discussion

My hypothesis was that the two pandemics, COVID-19 and childhood obesity, had a bidirectional impact on each other. Analysis of the NHIS data however disproved my hypothesis. Though NHIS data did not show a correlation between the two pandemics, it did suggest that both are influenced by similar variables. Thus, the results differed from the initial framework suggested in the study.

BMI in 2020 is significantly affected by Race, Sex, and Age as in 2022. This is interesting as one usually postulates lack of healthy, economical food choices or resources that lead to limited healthy meal options as the cause of childhood obesity. Data on income-related

variables was not available and thus could not be analyzed. Maybe genetic and cultural differences also affect BMI. However, more longitudinal analysis spanning multiple years would be helpful in delineating the effects of sociodemographic factors.

COVID-19 in 2020 was significantly not correlated with Race, Sex, or Age, while in 2022, it was significant with all of them. This could reflect differences in availability of COVID-19 testing between 2020 and 2022. Though testing was more widespread and home kits became available in 2022, certain sections of society believed in testing while others did not, making it hard to make inferences from this data and consider correlations between sociodemographic factors and COVID-19.

In 2020, BMI was significantly correlated to asthma, but not with diabetes. However, in 2022, both asthma and diabetes were correlated with BMI. The data from 2020 is interesting as one could consider that during initial COVID-19 lockdowns, fast food restaurants were essentially closed and hence more home-cooked meal options were perhaps taken up which may have decreased the incidence of diabetes. That was clearly not the case in 2022 as the usual eating patterns resumed. The other consideration could be that children did not get adequate healthcare in 2020 and thus were not diagnosed with diabetes by their pediatricians. Either case could be further evaluated by further longitudinal analysis.

COVID-19 was not correlated with asthma or diabetes in 2020, while it was significant with asthma but not diabetes in 2022. For COVID-19 in 2020, the framework based on the literature review suggested that a weakened immune system through asthma and diabetes affected the pandemic. NHIS data analysis does not support this hypothesis as there would have been more correlation seen between comorbid conditions that cause weakened immune systems and COVID-19 infection if such was the case. Difference between correlation of asthma and COVID-19 in 2020 and 2022 could be as more strict guidelines were likely followed in the initial phases of COVID-19 in 2020 as opposed to 2022 when there was fatigue from following guidelines and behavior returned to pre-COVID years including among those with asthma.

While mental health variables such as “Took Meds for Mental Health Problems” and “Frequency of Seeming Sad or Depressed” were significantly correlated with BMI in 2020 and 2022, the variable “How Often Seems Anxious, Nervous, or Worried” was correlated only in 2022. The likely explanation is that, in 2020, students were not going to in-person school, and hence BMI did not lead to anxiety because they did not feel social pressure due to their weight. However, by 2022, the schools were back in session and students were likely more anxious about their weight.

While the three chosen mental health variables were not significant with COVID in 2020, they were all significant in 2022. This was probably due to decreased student workload in 2020 because of school closures, but as the schools reopened, the day-to-day learning and socializing increased. This likely made student lives harder as COVID protocols like masking and social distancing as well as school lockdowns due to outbreaks caused increased anxiety in student lives.

The initial framework based on the literature reviews suggested that childhood obesity is influenced by variables such as loss of physical activity, screentime, and disruption of sleep patterns. The analysis of NHIS data showed significant correlation between BMI in 2020 and “Frequency of Regular Bedtime During School/Week Nights” and “Frequency of Difficulty of Getting Out of Bed,” as well as with physical activity variables “Attending PE Class” and “Participates in Sports Team in the Past 12 Months.” However, BMI in 2020 was not correlated with “Child Gets 2+ Hours Screen Time Daily.” In 2022, BMI was significant with sleep variables “Frequency of Napping and Falling Asleep During the Day,” “Frequency of Regular Waketime During School Days” and “Frequency of Regular Bedtime During School/Week Nights,” and for the physical activity variable “Participates in Sports Team in the Past 12 Months.” BMI in 2022 was also not correlated with “Child Gets 2+ Hours Screen Time Daily” like in 2020. Thus, it seems that BMI was influenced by several sleep and physical activity variables, but not by screen time as suggested by the initial framework.

In 2020, COVID-19 had no significant correlation to physical activity or screen time, but it had a significant correlation to the sleep variables such as “Frequency of Regular Wake time During School Days” and “Frequency of Regular Bedtime During School/Week Nights.” However, in 2022, COVID-19 was significantly correlated to “Child Gets 2+ Hours Screen Time Daily,” sleep variables such as “Frequency of Being Well-Rested” and “Frequency of Difficulty of Getting Out of Bed,” and the physical activity variable “Participates in Sports Team in the Past 12 Months.” Therefore, though data and individual variables vary between 2020 and 2022, COVID-19 likely thematically influenced the factors displayed in the framework. As far as screen-time is concerned, it was likely significant in 2022 but not in 2020 as more online learning tools were available in 2022. Moreover, children likely adapted around technology as behaviors changed with COVID.

There is not much literature that has studied the effect of COVID-19 on BMI, or on the effect of BMI on COVID-19, or the variables affecting the two pandemics. Overall, more studies are needed to understand the correlation between BMI and events like COVID-19, as well as the factors that influence the two. This paper was the first paper on this topic to use a national database. It is important to study this because it may lead to more knowledge about how childhood obesity could be prevented and what policy decisions may impact in its future decrease. One of the limitations of the study was the lack of availability of BMI data for multiple years, especially in 2019, 2021 and 2023, which would have been helpful in establishing patterns and studying the variables more rigorously. Hence, collecting the data with pre-specified variables that are needed can help us study childhood obesity more thoroughly and longitudinally, which could lead to insights that provide solutions in the future.

The Formation and Destruction of Saudi Culture: The Hijaz Region, 1925-2024

By Yinrui (George) Feng

Abstract

This paper discusses the motives and processes of heritage destruction in Saudi Arabia, primarily after the formation of the KSA, or the Kingdom of Saudi Arabia, in 1932. Starting from the Saud-Wahhab alliance, the state has a long history of heritage destruction. After the formation of the Saudi state, heritage destruction became mainly focused in the Hijaz area. A notable example is Mecca, where many of its sites did not align with the al-Sauds' historical narrative. The Saudi state treated these sites with indifference and used the revamping of these sites to diversify itself from an oil-based economy to a more balanced one through inducing tourism and Hajj pilgrimage-related visitation. Other sites that did align with the al-Sauds' version of history, such as those in the Riyadh region, were preserved and turned into tourist sites. Subsequent to the total Saud-Wahhab fallout in 1999, the destruction began in earnest. This is due to the conception of Vision 2030, a vision to diversify Saudi Arabia's economic portfolio. Through the destruction of heritage sites, the regime had created a Hajj-based economy for wealthy tourists and pilgrims through building hotels like DOKAAE while affecting the lives of local Hijazi people and Hajj-goers of a relatively lower socioeconomic background.

Introduction

Saudi Arabians are no strangers to heritage destruction. According to London's Islamic Heritage Research Foundation, over 98% of the Kingdom's "historical and religious sites have been destroyed since 1985" (Power). Twenty years ago, the architectural scholar Dr. Sami Agnawi acknowledged that we are witnessing the "last days of Mecca and Medina" (Howden). The house of the Prophet's uncle Hamza and Islam's first caliph—Abu Bakr—was demolished for a Hilton hotel and a Burger King (Power; Hameed). The house of the Prophet Muhammad's first wife, Khadijah, has been demolished for "public toilets" (Power; Hameed).

This is in stark contrast to the respect of the Islamic religion that the Arabs displayed around a millennia ago during the Crusades (Hillenbrand). Saladin's reconquest of Jerusalem in 1187, for example, was regarded as "the pinnacle of his career" (Hillenbrand). A celebratory ode captures this marvelously:

*"You [Saladin] have revived the religion of Muhammad and its props...
You [Saladin] have kept in firm order the office of the Holy War (diwan al-jihad)"
(Hillenbrand)*

The areas around Mecca and Medina were also considered sacred at a bygone time (Peters):

“The Mahometans have such high ideas of the sanctity of Mecca...[that] its territory is reputed [to be] sacred to a certain distance around, which is indicated by marks set for this purpose.” (Peters)

How and why is Saudi Arabia destroying the priceless religious assets that it once took pride in? This has a strong link to the royal family and its motives: the wealth of Saudi Arabia that is built upon oil, the workers’ movements that resulted from this affluence, and the political decisions in Saudi Arabia (Jones; Bsheer).

Methodology and Thesis

This paper will use the literature review method to explore how and why Saudi Arabia is destroying its famed heritage sites. According to historian Rosie Bsheer’s research, Saudi Arabia is doing so intentionally to ignore “material heritage that did not evince Al Sa‘ud’s own past” (Bsheer, “Heritage as War”). This also relates to Saudi Arabia’s massive modernization projects, which has led to the demolishing of buildings dating from the early days of Islam (Center for Strategic and International Studies; Bsheer, “Heritage as War”). The oil sector, in which these modernization projects are funded by, is also a key factor: it accounts for approximately 92.5% of “Saudi budget revenues” and 55% of Saudi Arabia’s GDP (Lele).

What is Heritage Destruction?

Heritage destruction is the “systematic erasure of intangible cultural heritage,” including “traditions or living expressions of culture passed down by ancestors” (Millender and Lyubarsky). Some instances of this destruction include looting, smuggling artifacts and the “physical destruction of cultural sites or objects” (Millender and Lyubarsky).

An example of this destruction is the reconstruction of the Mosque of Cordoba in Spain (Anheier and Isar). The magnificent mosque was built using some “800 columns...[that were] pillaged from Roman and Visigothic remains” (Anheier and Isar). After the Christians took over in 1236, the mosque was transformed into a cathedral, resulting in “the construction of a closed-off choir area” (Anheier and Isar). However, this vandalized the original image and cultural heritage of the Moors of Spain. The Holy Roman Emperor and King of Spain, Charles V, remarked that the building of this area that could have been “built anywhere” ruined “what was unique in the world [the Mosque of Cordoba]” (Anheier and Isar).

The al-Saud Family and Wahhabism

As Rosie Bsheer argues, the heritage destruction in the Mecca-Medina region was a conscious effort of the Saudi royal family to destroy and neglect the “material heritage that did not evince Al Sa‘ud’s own past” (Bsheer, “Heritage as War”). The reason for this cultural vandalization, however, leads back to the origin of the al-Saud family and how they regard their own heritage compared to the heritage of others, even if they have a highly important status in history of the Hijaz region.

The rise of the al-Saud family dates back to the 18th century in the small settlement of Dir‘iyyah (Gasirowski and Yom 8; Al-Rasheed). It all started when Muhammad ibn Sa‘ud of the Al-Sa‘ud clan became the local ruler in 1727 (Al-Rasheed). He consolidated his status amongst the residents of Dir‘iyyah—which the al-Sa‘ud family presumably founded—by a combination of landowning, sponsoring “journeys of long-distance merchants,” and offering the inhabitants protection in return for hiring them as a part of his own military force (Al-Rasheed). The style of leadership that Muhammad ibn Sa‘ud adopted consisted of ibn Sa‘ud having a weak “executive authority” except for “his [Muhammad ibn Sa‘ud’s] ability to collect tribute” (Al-Rasheed). This style of leadership was typical of Saudi Arabian emirs at that time (Al-Rasheed).

At that time, Muhammad ibn Sa‘ud’s leadership was lacking in two aspects: an identifiable tribal origin and a monetary surplus (Al-Rasheed). An “identifiable tribal origin” would have entailed a “strong association with” another tribe (Al-Rasheed). While Muhammad ibn Sa‘ud had a certain degree of ability to collect tribute from the residents of Dir‘iyyah, the commercial environment at that time wasn’t sophisticated enough to generate enough income, which would enable Muhammad ibn Sa‘ud to expand his authority to other regions or “control a large network of caravan routes” (Al-Rasheed).

As a result, Muhammad ibn Sa‘ud had limited influence that was only confined to Dir‘iyyah (Al-Rasheed). However, this all changed when the Al Sa‘uds incorporated the Wahhabi movement to their rule (Al-Rasheed).

The Wahhabi movement is a religious movement founded by Muhammad ibn ‘Abd al-Wahhab that is present in the cultures of Saudi Arabia and Qatar (Zeidan and The Editors of Encyclopaedia Britannica; Al-Rasheed, *A History of Saudi Arabia*). It advocated for the return to the “original teachings of Islam,” Muhammad and the Quran (Zeidan and The Editors of Encyclopaedia Britannica). They call themselves “salafis,” which is defined as the way of life of the first three generations of Muslims (Saiful Alam Shah Bin Sudian and Bin Ali; Commings). It also advocated for the literal interpretation of the aforementioned ideas (Saiful Alam Shah Bin Sudian and Bin Ali; Commings).

However, this religious movement was strongly centered towards Islamic supremacism and the discrimination of other beliefs—especially religious ones (Valentine). Wahhabism demonstrates some degree of bigotry towards the people who do not believe in Wahhabism (Valentine; PBS Frontline). They believe themselves to be “the spiritual elite...[and] the only true Muslims” (Valentine). In particular, they believe that other sects of Islam, particularly “Shia and Sufi, are wrong in their understanding of Islam” (Valentine; Ze’evi). This is due to the fact that Shia Muslims were the supporters of the descendants of Muhammad (Valentine; Ze’evi). These descendants were defeated by the Sunni Muslims, who were spearheaded by the Umayyads (Valentine; Ze’evi). The Shiites believed the scions of Muhammad were the legitimate leaders of Islam whilst the Sunni Muslims legitimized the conquest against the Shiites (Valentine; Ze’evi).

These ideas were approved by Muhammad ibn Sa‘ud (Al-Rasheed, *A History of Saudi Arabia*). According to Madawi Al-Rasheed, evidence shows that ibn Sa‘ud and Abd al-Wahhab formed a pact of political power in 1744 (Al-Rasheed, *A History of Saudi Arabia*). The two men agreed that ibn Saud would grant ibn Abd al-Wahhab political power and asylum while ibn Abd al-Wahhab would give ibn Saud the religious means to justify his conquest (Al-Rasheed, *A History of Saudi Arabia*). As a result, Abd al-Wahhab would be the leader of the Muslim clergy while ibn Saud becomes the “leader of the Muslim community” (Al-Rasheed, *A History of Saudi Arabia*).

As a result, the Saud-Wahhab pact quickly spread like wildfire (Al-Rasheed, *A History of Saudi Arabia* 20). One by one, Saudi towns and villages submitted to the Saud-Wahhab pact through coercion and monetary reward via the Wahhabi movement (Al-Rasheed, *A History of Saudi Arabia* 20). Thus, the 1744 political and religious contract between ibn Saud and Abd al-Wahhab led to the formation of the Saudi Arabian state in 1932.

The Baqi Cemetery, Islam, and Heritage Destruction

In the early 20th century, the reconquest of the Hijaz spearheaded by the Saud-Wahhab alliance led to the conquest of Medina. This reconquest led to the destruction of various heritage sites, one of them being Jannat al-Baqi—the Baqi Cemetery, which is Arabic for “the garden of tree stumps” (Mohammadi). Although being used as a cemetery before the conception of Islam, it was synonymous with “Islamic piety” ever since it became the resting place of the first “Companion of the Prophet...in 624/5” (Mohammadi). The destruction of this holy cemetery’s “domes, cupolas, and mausoleums” is one of the early examples of the Saud-Wahhab alliance’s intervention toward local heritage (Mohammadi).

Saudi Arabia’s Oil Dilemma

A year after the creation of the Kingdom of Saudi Arabia, an agreement was signed between the Saudi Arabian government and the Standard Oil Company of California (Saudi Aramco). The product of this agreement was ARAMCO (Saudi Aramco). Before 1938, the whole Saudi Arabian economy centered around the sale of pearls and dates (Boodrookas and Keshavarzian). The change to hydrocarbons occurred in 1938, where oil was found in the oil fields of Dammam at a depth of 1440 meters (OPEC). This “God’s blessing (*ni-ma*),” in the words of the Saudi Arabian history textbooks, appears in all aspects of Saudi Arabian life, notably in the economic, tourism, and hospitality sector (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

One of the reasons which made oil become Saudi Arabia’s blessing from God was its added economic benefits (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Having the largest known oil reserves in the world, it has a high level of autonomy in terms of pricing decisions (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Oil strongly benefited Saudi Arabia’s economy through a higher capital accumulation. As of 2023, Saudi Arabia made \$440 billion in revenue and an \$121.3 billion profit (Walt; Murphy). Oil accounted

for 40% of Saudi Arabia's GDP (Murphy). Saudi ARAMCO is significantly more profitable than its global competitors and currently has the second-highest net income in its record (Murphy). Since 98% of Saudi ARAMCO—the modern iteration of ARAMCO and the largest oil company globally—is owned by the Saudi Government and the remainder of it did not enter the stock market until December 2019, the profits of Saudi ARAMCO will indirectly belong to the Saudi Arabian government (Aramco; Gross).

ARAMCO and the US government, which was ARAMCO and the Saudi royal family's ally, protected the Saudi royal family, and thus became highly influential (Bsheer, "A Counter-Revolutionary State: Popular Movements and the Making of Saudi Arabia"). As British imperialism waned in the Gulf, the US began to incorporate Saudi Arabia into its own "sphere of influence" (Bsheer, "A Counter-Revolutionary State: Popular Movements and the Making of Saudi Arabia"). The US Ambassador Richard Murphy sums this up wonderfully: "We [the US] have become that power [that dominates the Gulf alone]" (Vitalis). Before long, ARAMCO heavily affected Saudi Arabia's society in both a political and economic way.

In the 1950s, however, the ARAMCO and its patrons' control was dwindling. The first wave of Saudi students who were educated abroad were returning home, and they soon saw the disparity between their homeland and their place of education abroad: the political regimes (Bsheer, "A Counter-Revolutionary State: Popular Movements and the Making of Saudi Arabia"). In their education abroad in locations such as France and Britain, they were immersed in a culture where people were legitimized and encouraged to participate in liberalist and socialist struggles against an imperial state (Bsheer, "A Counter-Revolutionary State: Popular Movements and the Making of Saudi Arabia"). When they returned to the very type of state that they fought against, they were critical of the Saudi regime and demanded for change through methods such as political participation and elections (Bsheer, "A Counter-Revolutionary State: Popular Movements and the Making of Saudi Arabia").

Education, it seems, equates to power. The brewing ideas of Arab nationalism spread like wildfire through the regions of Kuwait and—to a smaller degree—Bahrain when these educated students became a part of the labor force in these nations (Chalcraft). Also, trainees who were sent to nations like China, where they were immersed in a communist environment, came back with communist ideals and an increasing urge to equalize society (Chalcraft). These students and trainees soon formed organized entities to communicate and work toward their ideas of communism and egalitarianism (Chalcraft). The most prominent of these organizations was the Movement of Arab Nationalists—MAN.

This idea of egalitarianism and communism soon spread to ARAMCO. To keep up with its fledgling oil industry, Saudi Arabia hired migrants from other countries, such as Palestine and Lebanon (Chalcraft). By 1953, which was when the first of two major ARAMCO worker strikes occurred, ARAMCO employed 3000 Palestinians as a part of their workforce (Chalcraft). These migrants were congenial folk to the students, and they soon joined forces to advocate for their shared ideas (Chalcraft).

The first signs of discord were discovered between June and July of 1945 (Chalcraft). At that time, educated Iraqis who were employed by ARAMCO were involved in labor organizing (Chalcraft). This led to the rapid deportation of these employees (Chalcraft). Also, ARAMCO's educated Hijazi clerks and its Italian migrant employees joined in the strike for better pay conditions (Chalcraft). The deportation measures taken against the Iraqi employees and the tendency of better-educated people to lead and participate in strikes were precursors of what was to come in the next decade (Chalcraft).

The first of the major worker movements in the 1950s lasted from May to October of 1953 in the oil towns of eastern Saudi Arabia (Chalcraft). Most of the ARAMCO workforce joined the strike (Chalcraft). Interestingly, a part of the employees who went on strike were teachers in schools that were affiliated with ARAMCO (Chalcraft). The leaders of the worker movement drafted a petition that demanded for better pay, work environments, living conditions, and better treatment compared to their American counterparts (Chalcraft). They also advocated for the closing of the American air force base in Dhahran (Chalcraft). This movement wasn't recognized by ARAMCO, since labor unions were strictly banned at the time (Chalcraft).

As it turns out, many of the progressive ideas of Nasserism, Baathism, and communism that eventually spread around the nation originated from the Saudi oil fields in the Eastern Province (Chalcraft; Matthiesen). These oil fields were cultural and ideological boiling-pots with Italians, Lebanese and other Arabs intermingling and exchanging ideas with each other. As a result, the striking workers of ARAMCO weren't alone, either: clandestine organizations like the MAN supported them from behind the scenes (Chalcraft). The worker strike proved to be a failed one: the leaders were promptly imprisoned and many of the clandestine organizations in Saudi Arabia were forced into exile (Chalcraft).

Between the first and second worker movements, there was a two-year hiatus. A factor in making the second worker strike possible was the re-hiring of some migrants by Saudi officials who were sympathetic toward the labor movements (Chalcraft). One of these figures was Abd al-Aziz ibn Muammar (Chalcraft). He was an outspoken critic of the Saudi government, the American presence in Saudi Arabia, and the corruption that existed in the core of the Saudi royal family (Chalcraft). As a result, he patroned activists that acted against ARAMCO through means such as boycotts (Chalcraft). He also repeatedly hired strike leaders from the 1953 movement (Chalcraft). However, the Saudi government also cracked down on ibn Muammar's defiance, which led to the arrest and imprisonment of the latter from May 1955 to March 1956 (Chalcraft).

Strikes recommenced in May 1955 with similar demands as that of the 1953 movement. Similar to the 1953 movement, the employees and workers who went on strike combined the socioeconomic issues that existed in Saudi society and pan-Arab politics (Chalcraft). Interestingly, despite the actions taken by the Saudi government to crack down against ideas they deemed rebellious, there was still a sizable population of Nasserists, Baathists, communists, and socialists in Saudi Arabia (Chalcraft).

In 1956, the Egyptian leader Nasser and the Saudi monarch King Saud toured Riyadh and Dhahran (Chalcraft). The leftist population in these two cities—which proved to be a rather

sizable community—gave Nasser a “hero’s welcome” whilst King Saud was virtually ignored (Chalcraft). Again, the 1956 strike that ensued was affiliated with the clandestine organizations which patroned the 1953 movement (Chalcraft).

Pamphlets at that time showed that the majority of the population in the oil towns despised the American presence in Saudi Arabia (Chalcraft). The workers referred to Americans—in the pamphlet, at least—as corrupt “pigs” and proclaimed that the Saudi Arabian population was living under “the age of the Cadillac” (Chalcraft). Notably, the pamphlet featured the hammer and sickle, both symbols of communism (Chalcraft).

Similar to the 1953 movement, the movement of 1956 wasn’t a success. The Saudi Arabian government, which evidently started to perceive worker strikes in corporations as large as ARAMCO as a huge societal threat, harshly cracked down on leftist activism and a plethora of affiliated entities that were related to the strikes of 1956 (Matthiesen). These efforts to annihilate any major form of societal dissent was targeted towards the leaders of the labor movement (Matthiesen). These efforts led to the more clandestine and underground style of operation of Saudi Arabian and pan-Arab activist groups (Matthiesen). These movements began to operate in other nations to continue to voice their dissent against the Sauds of Saudi Arabia (Matthiesen).

Unsurprisingly, the vigor that was displayed by the ARAMCO employees on strike in both labor movements came from their leftist and more progressive beliefs (Chalcraft). Interestingly, however, the motive of protesting originated from belief instead of wage and condition improvements—though these were two of the major factors behind the strikes (Chalcraft). People who solely protested for more socioeconomic benefits were seen as people who participated with a comparatively vulgar motive (Chalcraft). “Manly honor,” as Chalcraft describes it, was seen as the higher purpose of striking (Chalcraft).

After the strikes of the 1950s, everything was going well from an economic perspective until the oil crisis of the 1970s and 80s hit Saudi Arabia. Through this oil crisis, oil prices plummeted due to the failure to keep prices high by reducing demand (Rundell). This was exacerbated by the unwillingness to cooperate displayed by other OPEC nations (Rundell). This resulted in an increasingly large deficit in the Saudi Arabian government (Rundell). By 2000, “100% of their [Saudi Arabia’s] national debt” amounted to 100% of its own GDP (Rundell). This caused alarms among the Saudi Arabian government, inducing then-King Abdullah to broadcast on Saudi Arabia’s internal TVs that “the party’s over” (Rundell).

At that point, the whole Saudi state—King Abdullah included—realized how the Saudi economy was structured had to change (Rundell). They realized that everything occurred because of the nation’s overdependence on oil—constantly accounting for 30% to 60% of its GDP from 1970 to 2000 (Rundell; Ismail).

This spirit of change started in the early 2000s, when the economic growth of China boosted the prices of oil again (Rundell). At that time, King Abdullah resolved to pay off all the accumulated debt that was accumulated in the dark days of the oil-based economy (Rundell). By 2014, which was when oil took Saudi Arabia into another economic tailspin, the Saudi government didn’t want to count on any external factors of good luck to save them from a

large-scale economic recession (Rundell). Instead, King Abdullah's successor, King Salman, came up with another idea: Vision 2030 (Rundell).

Vision 2030 was an elaborate plan that targeted Saudi Arabia's overdependence on oil (Rundell). The government aims to solve this issue through balancing its budget, creating new employment opportunities, and expanding into different sectors of the Saudi Arabian economy (Rundell). An example of this is to enhance the tourism and hospitality industries through adding vast hospitality facilities such as high-rise hotels to accommodate for the Hajj in Mecca and the non-religious travel sector (Rundell).

The Saud-Wahhab Fall-out, 1950-1996

On January 16, 1999, the Saudi Arabian state started its yearlong centennial celebration (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). In addition to commemorating the origins of the al-Saud regime, the Saudi government saw it as an opportunity to "enshrine the revised historical narrative" of Saudi Arabia (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). At this date, the organized, en-masse destruction of Saudi and Islamic heritage sites fully commenced.

There is an ancient Chinese proverb that can describe the complex relationship between the scions of the al-Saud family and the successors of the Wahhabi movement of Islam: "Allies can withstand hardships with each other, but they cannot share the fruits of their labor." When both the al-Saud state of Dir'iyyah and the Wahhabi movement were in their early stages, they cooperated closely: the al-Sauds were in charge of the conquest of Saudi Arabia whilst the Wahhabi religious leaders used their version of Islam to consolidate al-Saud's military control over newly-conquered territories (Al-Rasheed, *A History of Saudi Arabia*). At that time, it seemed like a win-win relationship: al-Saud would get the political and military ownership of the conquered territories whilst al-Wahhab would hold influence over the spiritual and religious minds of the inhabitants (Al-Rasheed, *A History of Saudi Arabia*). In the 1700s, at least, the Saud-Wahhab pact seemed like an invincible and inseparable one.

This wasn't the case, however, after the Saudi state was formed. When King Abdulaziz, the founding ruler of Saudi Arabia in its present form, decided to host a semi-centennial celebration of the takeover of Riyadh in 1950, it was cancelled since many of the "state-employed religious leaders" didn't obey the political will of King Abdulaziz (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). This demonstrated early visible schisms in the relationship between the al-Sauds and the Wahhabi leaders (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). At the turn of the century, when the scions of King Abdulaziz decided to host the centennial celebration of the conquest of Riyadh, the aforementioned schism changed drastically (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Bsheer tells us that "the [Saudi Arabian] religious establishment no longer posed an obstacle" (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). This shows that, during the 46 years that lay between the aborted semi-centennial and the centennial celebration of Riyadh's conquest, the win-win relationship between the Saudi regime and the Wahhabi

clergy shattered. Instead, the Wahhabi clergy found itself on the hot-seat in the Saudi regime's campaign against the movement.

What caused the aforementioned rupture between the two parties? After the build-up of friction in the aborted 1950 celebration, the Wahhabi clergy clearly had enough of the Saudi Arabian regime (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). In the 1970s, when the Gulf War increased Saudi Arabia's military spending, strengthened its relationship with the United States, and generated an enormous economic revenue through oil, the clerics started to rally against the regime (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). They rallied with other political dissidents and vouched for reforms that would guide Saudi Arabia to a more constitutional government (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Also, other anti-Saud groups began to voice their objections while alluding to Wahhabi ideas (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). This meant that the Wahhabi clergy had become an important part of the voice of dissent in the Saudi Arabian society.

The Wahhabi affinity to dissidents already made them very unlikable. However, their direct intervention in Saudi government affairs exacerbated the royal family's anger toward the Wahhabi movement. During the early days of the Saud-Wahhab pact, both parties outlined their boundaries of power when ruling the young state: the Wahhabi movement would control the legal, cultural, and educational affairs while the al-Saud family controlled the political and economic affairs of the government. Now, however, they publicly opposed the al-Saud regime and deemed it as irreligious, authoritarian, and overly reliant on foreign nations—notably the United States (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). This commentary in politics trespassed the age-old boundary and weakened the political capabilities of the al-Saud family. Through violating a tenet in the Saud-Wahhab pact of the 18th century, it seemed that the ultimate farewell was imminent.

The final straw that brought the metaphorical camel of the Saud-Wahhab pact to its knees came in 1979. At that time, Wahhabi clergymen and their civilian sympathizers regularly defiled the nation's heritage sites with "great impunity" (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). In 1979, hundreds of armed Saudi civilians—who were once Wahhabi—took over the Grand Mosque of Mecca for three weeks (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The cause of this attack was rooted in the fact that these dissidents were disappointed about the Wahhabi clergy's indifferent attitude towards the "irreligious" rule of the Saudi royal family, which referred to the regime's corruption and its strengthening alliance with the US government (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). In other words, they wanted to "purify Wahhabism" (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). As a result, this challenged the Saudi royal family's religious legitimacy and threatened its rule over the nation (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

What was originally intended to purify the movement ended as a fiasco. Similar to the ARAMCO worker strikes of the 1950s, the Saudi government quickly acted against the

imminent threat of losing power by using its own authoritarian methods (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). It quickly paused the broadcasting of all news sources in relation to the 1979 insurgency at the Grand Mosque, except for the state-owned news source (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Any other mention of the insurgents and their attack and the subsequent occupation of the Grand Mosque was prohibited during the event and the subsequent suppression process (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Ultimately, the al-Sauds prevailed. The regime quickly scored “military and symbolic victories” over the insurgents, who were depicted as Shia terrorists and Iranian fifth columnists (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Ironically, the government completely ignored the fact that the insurgents were once Wahhabi, meaning that they were devout Sunni Muslims (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Thus, the once-great Wahhabi sect was struck down in one blow by its ex-collaborator and patron, being depicted as the archenemy they worked to fight against (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

The Geopolitics of Heritage Destruction, 1999-present

The approximate date when Wahhabism loses its power roughly coincides with the Saudi economic crisis of 2000. With its overdependence on oil, Saudi Arabia found a solution through turning away from the various hydrocarbons and its related industries (Rundell). As an effort to create specific steps to ensure the success of this undertaking, Vision 2030 was developed (Rundell). Vision 2030 had, among other components, aimed for the rapid development of one industry: tourism and hospitality (Rundell).

The demand for tourism and its related hospitality needs were immense. Saudi Arabia’s tourism industry, however, is nuanced (Rundell). The main reason for this disparity to the majority of tourism industries in other countries centers around a part of Saudi Arabia’s tourists: they came for the Islamic pilgrimage (Rundell).

Saudi Arabia is home to the Hijaz region. This region encompasses two cities: Mecca and Medina—more commonly known as the locations in which Islam was conceived and expanded from (Rundell). All Muslims are encouraged to go to Mecca at least once during their lifetime (Rundell). Since this region is situated in modern-day Saudi Arabia, the pilgrimage—more commonly known as the Hajj—gives Saudi Arabia an opportunity to generate economic revenue and sever the overreliance of its economy on oil.

Mecca and Medina attract many tourists. Projections show that Mecca would accommodate 17 million tourists a year by 2025 (Wainwright; Power). To increase Mecca’s ability to accommodate the growing number of tourists, infrastructure facilities such as metro lines and hotels must be built (Wainwright).

The only cost of this accommodation, however, is that heritage sites around the Hijaz were destroyed (Wainwright). The library that marked the birthplace of the Prophet, for example, was “next in the firing line” as of 2013—planned to be replaced by the Meccan imam’s home

and then-King Abdullah's "presidential palace" (Wainwright; Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Its neighbors are already destroyed, replaced by high-rise hotels and public lavatories (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). What looks like an act to meet the growing tourist demand is a façade. The motive for the change of the cityscape around Mecca and Medina is a more calculated one—an indifference to the record of the Prophet's life and emphasis on the secularized historical narrative of Saudi Arabia (Wainwright).

The al-Sauds have always aimed to conceal parts of the region's history before the formation of the nation. Before the turn of the century, this involved rewriting the state's history books and concealing the traces of Ottoman society and its complex intellectual networks (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). As a result, the Saudi state's battle against other states' heritage centered towards brainwashing and the destruction of intellectual heritage (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

A perpetrator of the destruction of some of Mecca and Medina's most sacred sites was the Saudi Binladin Group, more commonly known as the SBG (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). It gained the support and trust of the al-Sauds back in the mid-20th century when the nation was relatively divided (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Through this trust, it gained tens of billions of dollars with the Saudi regime through Meccan destruction and reconstruction projects, many of them redundant and purposefully built to generate economic return (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

At that time, the al-Sauds were not able to govern the whole nation on their own in a unified way due to a lack of financial and political resources (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The profits brought by oil weren't enough even during the 1950s—when oil profits started to trickle down into the specific departments of the government—to support the fledgling state's financial needs (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

As a result, the Saudi regime "outsourced" the governorship of some of its regions to corporations (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). While ARAMCO governed and built cities such as Dhahran and Dammam in the Eastern Province, their influence was relatively confined to the Eastern region of Saudi Arabia (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The SBG and its founder Binladin, on the other hand, impressed the al-Sauds with their ability and willingness to provide significantly lower construction costs—sometimes free of charge—for the royal family compared to ARAMCO (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Although the Saudi regime regularly couldn't pay the SBG in terms of construction costs, Binladin gained the regime's trust through these lower costs and broke ARAMCO's construction monopoly (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Subsequently, they rapidly gained contracts to expand the Prophet's Mosque at Medina (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The success of this project not only made the SBG famous and reputable; it also gave

the company a second contract: the expansion of Mecca's Grand Mosque (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). After this contract, Binladin became the "director-general of construction works of King Abdulaziz" (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). In other words, he was the de-facto "royal builder" (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

The contract that the SBG gained signified the start of its decades of de-facto governorship, destruction, and recreation in the Hijaz (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). From then on, it built complex roads, airports, hospitals, mosques, and universities across the whole nation and procured some of the largest construction contracts that the country had to offer (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). the SBG was so affluent that it frequently lent money to King Faisal and his successors during the financial crises of the 1970s (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Through being the financial savior of the regime, the SBG gained the practical control of all aspects of government in the Hijaz, rendering the local governor powerless (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

This control over the Hijaz started a cycle of redundant and heritage-destroying construction projects. In the 1970s, the Saudi government commissioned international architectural firms—such as the international architecture firm RMJM—to create urban designs for the Hijaz (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). RMJM's plan, which was completed in 1973, proposed to increase Mecca's infrastructural capabilities, which equated to the expansion of roads and the inclusion of parking spaces for incoming vehicles (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). However, this required the demolition of heritage sites and artifacts (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The potential destruction worried the Meccan residents, whose anxiety was only exacerbated by the increase of oil prices in the same year (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

By 1976, the SBG's construction projects (which were supported by the Saudi Arabian regime) were unpopular among intellectuals and residents alike. Dr. Sami Agnawi of the Hajj Research Center summarizes the widespread sentiment perfectly:

"Modern Mecca has all the worst characteristics of modern cities throughout the world without their redeeming qualities. Present day Mecca is noisy, ugly, dirty and smelly and has been sold to a new god: Money. The modern architecture is appalling (with one or two notable exceptions) and is out of human scale...trees and landscaping are almost non-existent and...[they] lack imagination [wherever they exist]. The situation is so bad that either nobody notices or cares about Mecca or is too embarrassed to talk of it. Mecca is the scene of inter-ministry conflict and personal ambitions of land and property speculators." (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*)

These aforementioned institutional rivalries resulted in redundancies and a great amount of confusion (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Compared to Riyadh, whose urban planning was meticulously managed through the Ministry of Municipal and Rural Affairs—MOMRA—Mecca’s urban planning endeavors was practically in a state of anarchy (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Spearheaded by the SBG and followed by other organizations, the priority of the competition over “lucrative contracts...and the interest of property speculators” far exceeded the needs of “pilgrims, residents, the environment, and [most of all] planned urbanization” (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Shortly after the start of King Fahd’s reign, he decided to further expand the mosques of Mecca and Medina (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). As per usual, the SBG was in charge of the bulk of the construction (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Another renowned figure was involved, though: the Egyptian architect Kamal Ismail (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Famous for his mosque designs in Egypt, he had previously impressed King Abdulaziz and then-Prince Faisal—who was then the viceroy of Jeddah and the Saudi foreign minister—when they met to discuss plans for the building of the Saudi foreign ministry in 1952 (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The *ustadh al-ajyal*—the “teacher of generations” in Arabic—as Ismail was affectionately called, gained Fahd’s trust and was supported by the the SBG, since they had a long-standing professional relationship (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Unbeknownst to King Fahd, however, Ismail had already formulated such plans of expansion with the the SBG beforehand (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). By the time Fahd had announced his intentions to the the SBG, the organization persuaded Ismail (who was undoubtedly under its payroll) to increase the scope of expansion (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Under the guise of expanding capacity to the growing number of pilgrims, the project began. Both the regime and the SBG knew that this construction project wouldn’t be enough to house the pilgrims even before its completion (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). However, neither party terminated nor revised the project and saw it as a great opportunity for the accumulation of capital (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Fortunately for Mecca and Medina, Ismail deemed the two cities as sacred (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). As a result, he endeavored to minimize damage to the cultural heritage and natural topography of Mecca (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). He avoided destroying historical artifacts when possible and safeguarded them when not (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Also, Ismail proposed to limit the height of buildings in Mecca and proposed the removal of “upper floors where necessary” (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). In addition, he also proposed to create a new form of architecture that was unique

to Mecca and is compatible to its heritage sites (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). In conclusion, Ismail attempted to curb the chaos that was characteristic of Meccan urban planning.

In one way or another, Meccans were fortunate that Ismail was in charge. His plans were far less harmful to Mecca's heritage and topography compared to the other plans that the SBG and the regime made (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). It regularly ignored the Mecca Development Authority—MDA—and MOMRA's suggestions and the SBG effectively had carte blanche to build the city (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Pushed by the Saudi regime, who saw building plans and the SBG's efficiency in completing them as usable political tools, the SBG created plan after plan to rebuild Mecca that were far more harmful than Ismail's original master plan (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

As the 20th century ended, the Saudi state started to preoccupy itself to the more complete revising of its historical narrative (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Since Meccan buildings and heritage sites told a different story as the revised narrative of the al-Sauds, Saudi authorities oversaw the en-masse and accelerated destruction of "sacred [religious] and historical sites in Central Mecca" after the turn of the century (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The replacements of Mecca's heritage sites were "imposing steel-and-glass skyscrapers," shopping malls, cranes, and smog—which enveloped the *Masjid al-Haram*—the Grand Mosque of Mecca (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Ironically, the Saudi regime had its own religious explanations after the bulldozing of Islam's most sacred sites (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). It patroned religious scholars who pointed out that destruction fuels innovation (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Ironically, the al-Sauds themselves were the ones that criticized the Ottoman Empire for their mismanagement of the Hijaz less than a century ago (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

To prepare for the construction of these megaprojects, however, the al-Saud family needed to procure the land that made the subsequent building possible. To do so, King Fahd, then-Crown Prince Abdullah, and other high-ranking officials and bureaucrats purchased properties that revolved around the Grand Mosque at "below-market prices" (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Afterwards, they sold the land back to the Saudi regime at a far more inflated price (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The legal owners were given a small amount of compensation and were forced away from their homes (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Through these transactions of land, the Saudi regime were able to further profit from the Hajj through increased rent, "unearned income," and other fees (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Thus, the urban planning of Mecca had nothing to do with age-old heritage sites; instead, it followed the whims, demands, and capital benefits of the Saudi regime, the SBG, and tourists (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*; Power). In 2011, for example,

the Ottoman-era portico and columns surrounding the Grand Mosque were destroyed (Power). It was done to expand the Mosque to accommodate more Hajj-goers and tourists (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

The first example of the destruction of Meccan and Islamic heritage sites came in the form of a commercial project that had governmental origins (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). It was the Development of King Abdulaziz Endowment Project (DOKAAE), built on Mount Bulbul (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The main builder was—as usual—the SBG, which covered the majority of the \$15 billion construction costs (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Like other projects, the building of DOKAAE required demolishing other sites, including the southern part of the area adjacent to the Grand Mosque and the Ajyad Fortress (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The fortress, which was built during the Ottoman era and was thus a Turkish heritage site, was destroyed in secrecy by the SBG in 2002 (Times Staff Writer). The plan to destroy the fortress being announced hours before its destruction was a common practice at that time, giving residents no time to prepare nor protest (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The Ajyad Fortress suffered the same fate as the house of the Prophet's grandson, Ali-Oraid, which was destroyed in hours (Howden). In addition to the fortress, Mount Bulbul was detonated for the development of the project (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Saudi officials denied all allegations related to the destruction of Mount Bulbul and the Ajyad Fortress after the event (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

A huge amount of domestic and international outcry followed. The Turkish, in particular, were outraged by the destruction of the fortress (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). After international pressure, the Saudi regime proclaimed that the Ajyad Fortress was neither sacred nor historical: it had lost its purpose of protecting the Grand Mosque after the “restoration of security” in the al-Saud era (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Thus, the building of DOKAAE proceeded. The result of it was multiple high-rise skyscrapers—one of which became the tallest building in Saudi Arabia. This building housed the world's largest clock—dubbed the “capitalist clock” by those who “opposed the new urban vision for Saudi Arabia.” The DOKAAE towers are populated with internationally-renowned hotels, such as Mövenpick, Pullman, and InterContinental (Tripadvisor). As Shoujaa Zaidi, who was Vice-President of Project Management and General Manager of Makkah Hilton Hotel and Towers, puts it: “Mecca is now at its peak” (Sfeir).

Despite all the financial benefits that DOKAAE brought to the Kingdom, it was evident that the multi-billion project was merely transitory. When King Abdullah was confronted with comments of the ugliness of the products of DOKAAE—most notably the clock, which was dubbed a “disaster” due to the lack of urban planning in the words of MOMRA—the King commented that the next King could “demolish it [DOKAAE] and build something that he likes better” (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

This rather temporary trend of Saudi architecture and heritage also diffused its way into royal palaces. The multi-million dollar King's Palace, situated on Mount Abu Qubays and overlooked the Grand Mosque, was destroyed in the blink of an eye (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). In the mid-2000s, the al-Sauds authorized the SBG to facilitate the transition of the Saudi royal palace to the top two floors of a DOKAAE tower (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The existing palace was turned into "additional prayer space" in the Grand Mosque (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

The urban revamping of Mecca is similar to that of Jeddah, the nation's second-largest city and gateway to Mecca (Tanis). In early 2022, the Saudi regime announced a \$20 billion plan to "redevelop old areas" in southern Jeddah (Tanis). The goal of this redevelopment is to attract tourists and wealthy foreigners to the region through the construction of high-rise hotels, parks, opera houses, and other urban structures (Tanis). Like Mecca, this involved revamping historic districts in Jeddah (Tanis).

Unfortunately, hundreds of thousands of residents will be displaced (Tanis). A sizable part of this displaced population are working-class immigrants (Tanis). Entire historic neighborhoods were torn down in days' notice (Tanis). In some cases, residents were notified to move out twenty-four hours prior to demolition (Tanis). Like Mecca, this gave residents no opportunity to protest nor disagree against the revamping acts of the Saudi regime (Tanis).

The destruction in Mecca and Jeddah is in stark contrast to the creation in Riyadh. Due to the fact that Riyadh had closer ties with the Saudi regime and its proximity to Diriyah, the Saudi regime—spearheaded by then-Prince Salman and then-King Abdullah—started to intentionally create heritage in Riyadh (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*; The Editors of Encyclopaedia Britannica; Rome2Rio). After the 1991 Gulf War, flocks of urban planners, economists, archeologists, tourist consultants, and other specialists swarmed into Riyadh (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Under then-Prince Salman ibn Abdulaziz, who was the Governor of Riyadh, the Commission for the Development of Arriyadh—HCDA—was created (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*; The Editors of Encyclopaedia Britannica). In conjunction with the Arriyadh Development Authority—ADA, which was also the governing branch of HCDA—and MOMRA, a plan for recreating Riyadh's image was created (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). It was named the Metropolitan Development Strategy for the Arriyadh Region—MEDSTAR (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Unlike development plans for Mecca, Medina, and Jeddah, Riyadh's revolved around creation instead of destruction (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*; Tanis). Based on a twenty-five year strategic plan and an executive plan that would last a decade, MEDSTAR aimed to turn Riyadh into the true "administrative, cultural, economic, and historical center of Saudi Arabia" (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The Arab version of these Soviet-styled plans strived to recreate Riyadh by emphasizing its historical

sites, mostly in the “historical district”—*Al-Mantiqa al-Tarikhiyya*, also known as Historic or Old Riyadh (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

MEDSTAR took advantage of the fact that most of Riyadh’s historical sites were made of adobe and were deteriorated (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). They planned to turn historical sites into tourist attractions, thus boosting a cycle of historical tourism in Riyadh (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). This approach to tourism and economic growth had a benefit: erasing Wahhabi traces in the nation while generating revenue for the Saudi government (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

After the Saud-Wahhab fallout, the regime—or Prince Salman, at least—feared of the resurgence of Wahhabism. This fear emerged when MEDSTAR was conceived. Through investing in historical sites in Riyadh, it would be more difficult for the Wahhabi sect to gain an ideological foothold on the Saudi people, making a potential coup against the regime less likely to occur (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Then-king Abdullah supported MEDSTAR for three reasons: legitimization of the al-Sauds’ rule, generating economic revenue, and non-religious tourism. Through exemplifying the rich history that Riyadh had and its close ties with the al-Saud state—especially with Dir’iyyah at its close proximity and it being within driving distance of Riyadh—Saudi citizens and outsiders alike would believe in the al-Sauds’ version of history (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*; Rome2Rio). Also, Abdullah saw an opportunity to generate domestic and international revenue through curating tourist-specific experiences in historical sites, which can increase the number of visiting tourists (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Lastly, this style of tourism strayed away from the traditional and seasonal religious tourism generated from Mecca (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). This both created another stream of tourist revenue that benefited the Saudi regime through diversification and estranged popular Saudi opinions and thoughts from Wahhabism (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

In conclusion, the Saudi regime categorizes heritage sites (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). For those that are beneficial to its political cause, augments the legitimacy of the al-Sauds’ rule, estranges its ties from Wahhabism, and generates economic revenue, the regime keeps; all other heritage sites in regions other than Riyadh, specifically Mecca and Medina, are destroyed (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). This is due to the rich historical heritage of Mecca in pre-Saud times (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). As a result, the heritage destruction in Mecca and Medina is an intentional process to generate revenues and cleanse any evidence against the al-Sauds’ edited historical narrative (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Motivated by political and economic factors, the twenty remaining Prophet-era sites that were standing as of 2005 may be destroyed at any time (Howden). As Dr. Sami Agnawi says, we are currently facing “the end...[of] Mecca and Medina” (Howden).

The Effects of Heritage Destruction, 2010-present

Originally, Mecca was a site of worship and commemoration that signifies the creation of Islam. Now, it has been turned into a site in which only the most important sites remain and others are destroyed—replaced by sprawling infrastructure systems and skyscrapers with high-rise hotels (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The land used to build international hotels came at the cost of the demolition of the man-made and religious history of Mecca (Howden).

The loss of heritage is widespread. The first Islamic school in which the Prophet taught, for example, was lost under a frenzy of construction, which often occurred at night (Times Staff Writer; Power). In Medina, the Prophet's tomb alone survived the revamping of the surrounding city (Times Staff Writer). As foreign media points out, it is now easier to find a Cinnabon in Mecca than the Prophet's birthplace (Times Staff Writer).

Undoubtedly, the Hajj and accompanying heritage destruction have brought more economic benefits to the regime. This is perhaps best demonstrated through real estate prices (Sfeir). A square meter of land in Mecca costs up to \$100,000 as of 2011, making Mecca one of the most—if not the most—expensive city in the world (Sfeir). The new hotels built on the land provided great accommodation space for the 1.8 million yearly Hajj-goers as of 2023 and encouraged international accommodation competitors to enter the Saudi market (Saleh; Saha; Sfeir). This trend also has no sign of stopping (Sfeir). In 2024, for example, a \$667 million scheme to further develop Mecca's hotel industry was signed at the Hajj and Umrah Services Conference and Exhibition (Saha).

In addition to the aforementioned changes, Hajj-goers in Mecca have found themselves in a different world in other ways, such as the changes in economic conditions for the local inhabitants, safety concerns, and the increasing emphasis on capital accumulation from the Hajj.

Although there are certainly economic benefits in heritage destruction, the consequences are also evident: its effects on the affected inhabitants' livelihood. An example of this is when the residents of the area encountered the Al Shamiyya Development Project (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). It offered local residents and property owners two options: selling properties to them at prices that are significantly below the valued worth or accepting shares in the development as compensation (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). After much negotiation, the powerful corporate entities behind the project—spearheaded by the SBG—either purchased properties at 10% of the property's worth from the inhabitants or “forcibly evicted” them (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). The inhabitants and property owners were left without any legal means to advocate for themselves (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). These residents were either forced to the outskirts of Mecca or slums within walking distance from the Grand Mosque (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Both of these sites were discreetly hidden away from domestic and international tourists' view from their areas of visitation (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). As a result, the local property owners should be “thankful for any compensation that they receive,” and through

heritage destruction, Meccans' livelihood and socioeconomic status are substantially reduced (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*).

Similar effects are felt in Jeddah (Tanis). Through the destruction of heritage, whole communities are destroyed (Tanis). Many residents in the revamped districts were astonished and distraught; this has forced them to live outdoors, making them prone to the wrath of the elements (Tanis). A soon-to-be-destroyed neighborhood contained a Sudanese coffee shop, which regularly hosted a community of Sudanese immigrants (Tanis). Now, with the coffee shop facing destruction, the community has lost a location to congregate and connect, giving the residents “nowhere else...to go” other than work and home (Tanis). Although residents pointed out that the area's infrastructure needed urgent fixing, this proved particularly difficult for communities that are marginalized and have limited options to flourish (Tanis).

The ongoing construction around the Grand Mosque has also resulted in safety concerns (Hameed). In 2015, for example, one of the tallest construction cranes in the world smashed into the Grand Mosque amid stormy weather (Hameed). This led to at least a hundred deaths, many of which were pilgrims preparing for their evening prayer (Hameed).

What exacerbates this issue is the lack of adequate medical and life-saving facilities in and surrounding Mecca (Hameed). The Ajyad Emergency Hospital, located beside the Grand Mosque, only has fifty-two beds (Hameed). The Al Noor Hospital, being slightly larger, is four miles away from the Mosque (Hameed). Both hospitals do not have a blood bank (Hameed).

Another example of Mecca's insufficient facilities is the fire department (Hameed). When Mecca's firetrucks' engines “couldn't handle the blaze,” the fire department had to ask Taif, a city that is over an hour away from Mecca, to help (Hameed). These insufficient facilities have generated huge safety concerns. However, after cleaning up the blood, Saudi Arabian construction crews continue to create and destroy (Hameed).

Hajj-goers have also found a change in the Hajj-going experience. Many pilgrims came for the spirituality of the Grand Mosque and a “clear focus to center God [Allah] in my life” (Masroor). However, when witnessing the imposing skyscrapers around the Mosque, they find no spirituality—the skyscrapers can be found anywhere in megacities (Masroor).

Also, the Hajj has transformed into an activity for the super-rich. The cost of Hajj-going has increased threefold, making the experience “unaffordable for ordinary people” (Masroor). This betrays the purpose of the Hajj, centered around eliminating socioeconomic inequalities (Masroor). The Hajj is soon a “materialistic ritual” for the rich to “display their wealth and nobility,” instead of reconnecting pilgrims to the Prophet and Allah (Masroor). Thus, there is a change in the Hajj-going experience in recent years.

Conclusion

Saudi Arabia has a long history of heritage destruction. Under the Wahhab-Saud partnership two centuries ago, the Baqi Cemetery was destroyed. Over time, subsequent to the occupation of Mecca and the formation of the Saudi state, the Saudi state gradually developed a geopolitical trend of historical sites. For ones that didn't support the al-Sauds' heritage, notably

the ones in the Hijaz, the regime treated them with indifference. If these sites generate economic benefits to diversify Saudi Arabia's oil-based economy after oil-based crises and recessions—such as the Ottoman Ajyad Fortress and Mount Bulbul—it will be destroyed regardless of its historical heritage. For sites that support the al-Sauds' version of history—such as those in Riyadh—will be kept and well-maintained. This trend is notable after the turn of the 21st century following the Saud-Wahhab fallout.

As Rosie Bsheer says, "Cities are always in the making...[and] they are never fully made or remade" (Bsheer, *Archive Wars : The Politics of History in Saudi Arabia*). Cityscapes capture the social movements of the region and nation. Saudi Arabia, through the destruction and recreation of heritage, perhaps embodies this best.

Investing in Our World: An Analysis of Sustainable Investing and the Chip Industry

By Sahasra Valluri

Abstract

This investigation aims to explore the intersection between investing and sustainability and analyze its relation to the chip industry. It focuses on sustainable investing, its tenets, and what advantages it brings to investors and the company itself. The chip industry provides a unique example of sustainable investing and its impact on the growth and popularity of a company. By comparing chip companies Nvidia and Intel regarding their development, sustainability reports, and product profitability, this study will show that sustainable practices and initiatives from a company will place them ahead of their competitors. Furthermore, the growth of these companies and sustainability have a direct correlation, as represented by the case studies of Nvidia and Intel, demonstrating the potential business advantages gained when a company prioritizes its environmental impact.

Introduction

Investors are divided by the decision between supporting the environment or their profit margins; when thinking about business and the environment, investing is often viewed as binary. It is common to be predisposed to the rigid business ideology, focusing solely on profit. Conventional businesses often prioritize profit and efficiency for the consumer. This entails a high level of innovation, greater short-term profit margin, and a reliable consumer basis. Often, this conflicts with adaptation to environmental, social, and governance standards, or ESG. The products do not offer a sustainable demand when looking from an environmental lens. This is not exclusive to environment-focused businesses, but rather those that prioritize the long-term growth of their product as ESG standards transform through time. However, this comes at the expense of the environment and given new world issues, investors have a strong initiative to explore sustainable investing.

As early as 2006, finding a middle ground for sustainability and profit was a priority, for example, when “the UN-backed Principles for Responsible Investment (PRI) was launched, 63 investment companies (asset owners, asset managers, and service providers) with \$6.5 trillion in assets under management (AUM) signed a commitment to incorporate ESG issues into their investment decisions.” (Eccles et.al) This shows the interest of companies to engage in sustainable investing and try to shift the primary focus of investing from profit-focused to both profit and environment. Though a relatively new concept, sustainable investing is growing in influence, bridging the gap and encouraging investors to profit from saving the planet.

As reported by the EPA (Environmental Protection Agency), pollution, carbon emissions, resource depletion, and improper waste disposal plague our world with long-lasting problems. (EPA) These issues affect the environment and our everyday lives, which have caused them to gain attention recently. With the growing connectivity of the world, environmental issues affect every sector of life. Some industries produce environmentally harmful products that have a very

high demand due to medical reasons. One example to consider is the tobacco industry, which is a potentially addictive substance when it is used. Over the past three months, Philip Morris International, a top player in the tobacco industry, has grown seventeen percent, which is a significant turnover for a consumer good; however, the product they market affects the environment due to emissions and littering of cigarettes, and its tobacco source damage farming land, making it unusable (Yahoo). The goods generate profit because there is a consistent demand for them due to the nature of the product, but they cause a tremendous amount of environmental damage in addition. The profit makes it a lucrative company for investors, but that is not the case when analyzing the byproduct of its production. However, some investors have taken on the responsibility to support the businesses that grow economically and environmentally.

What is Sustainable Investing?

Sustainable investing starts with business structures that proactively adapt to ESG standards, rather than reactively. Specifically, these businesses often create eco-friendly products that are efficient and appealing to consumers. This may initially hinder their profit margins in comparison to the companies that focus on profit and consumer satisfaction because the competitor may make a cheaper or more practical product, compared to the environmentally conscious product which comes at a premium of time or money. However, it presents a safer long-term alternative for investors who want to invest in the planet while making a profit.

Environmental initiatives take careful development and time. The companies that have decreased their carbon footprint present a reliable foundation for investors who are hesitant about possible environmental restrictions. Whereas, conventional companies that are not yet utilizing environmentally-conscious technology often have to work within time constraints which limits their product efficiency and reliability. This, specifically, entails the technology of a product and its environmental impact, as well as, the use of a product for environmental benefit.

In her TEDx Talk, Karina Funk defines environmental business advantages, (EBA) as the advantage of certain companies as they pursue environmental objectives whilst innovating their product (Funk). For example, the chip company Arm is creating chips that are energy efficient and have a low carbon footprint, which gives them an advantage against their competitor, Intel. Companies that have a greater EBA are environmentally conscious and can focus on the efficiency of their product in the face of stricter regulations. Environmental business advantages are directly related to the proactivity of a company, allowing them greater freedom as the world rapidly changes.

Moreover, in terms of EBA, the UN Sustainable Development Goals go hand in hand with sustainable investing, as they provide a framework for what a company needs to focus on. There are 17 in total, however, for the sake of this article, only 5 apply; 7 - Affordable and Clean Energy; 8 - Decent Work and Economic Growth; 9 - Industry, Innovation and Infrastructure; 12 - Responsible Consumption and Production; 13 - Climate Action (United Nations). These specific goals guide companies through sustainable development, proving no lack of education and

resources to help create an environmental initiative, solely a lack of awareness.

How does sustainability relate to the Chip Wars?

Two companies, Nvidia and Intel, have engaged in a “chip war” and have been competitors for profit, despite Nvidia’s astronomical stock growth in the past year. By adapting to environmental needs, earlier than necessary, both companies have an advantage long-term compared to others who have focused on monetary growth.

Currently, Nvidia is the 2nd largest publicly traded US company. They specialize in GPUs that were underestimated until recently with the boom of gaming and AI. NBC reporter Rob Wile explains that Nvidia got ahead of their competitors and has created a sustainable demand, as their chips are used in all Tesla vehicles (*How Nvidia grew to a trillion-dollar company fueling the AI Revolution*). Additionally, they offer solutions for a plethora of fields, from transportation to healthcare. The sourcing of their materials and software was ahead of its time and they are moving consistently with innovation. In 2022, the Biden administration’s CHIPS and Science Act increased GPU development, giving them ESG advantages as well. All considered, investors find their data center and digital infrastructure very strong in comparison to other companies.

Nvidia has grown exponentially within the past 6 months, up by 166.22% with a net worth of 2.962 trillion, according to Yahoo Finance’s report (*NVDA*). Likewise, their sustainability report reflects their growth (Nvidia Corporation). They have a focus on healthcare and consumer goods, such as cars. This creates a consistent demand for their product. When reading the sustainability report, they are transparent about its initiatives to combat climate change and other environmental issues. They also pay close attention to the energy usage in their data centers, which has been a topic of conflict. They report a goal to decrease their usage by 50%. Using their AI chips, they model climate impacts to help society adapt to its evolving world. Likewise, they use their AI to innovate clean energy. They aim to create a new social image for AI through innovation and sustainable practices. They plan to do this through healthcare advancements: drug discovery, genomics, and medical imaging and transportation: self-driving vehicles and efficient navigation systems.

As reported by Yahoo Finance, Intel, however, has declined considerably within the past 6 months, down by 26.7% with a net worth of 129.473 billion (Yahoo). Their sustainability report emphasizes their focus on sustainable manufacturing and supply chain for their chips and other products (Intel CSR Report). Moreover, they prioritize water conservation, zero emissions, and a circular economy with their products. They are using drone technology to map out changing geography and provide healthcare to underserved populations. Collaboratively, they are creating coalitions with other companies for further growth in sustainability. Uniquely, they are working against AI instead of with it. They created FakeCatcher to detect fake videos created by AI and have established this technology to work against the invasion of AI. This is beneficial to a greater whole, however, it lacks innovation with the developing technology in AI.

In the S&P 500, Intel has been the worst-performing tech company in 2024. There is a

weakening demand for their product with the popularity of GPUs and therefore, reinforces the trend towards Nvidia. Intel's underinvestment in AI and GPUs has put them behind and caused seven subsequent quarters of decline. They have been on the sidelines of mobile chip development and now AI development, which continues to hinder their progress. Kif Leswing, a CNBC reporter, claims that the progress worked well in the early 2010s then started to compound delays in innovation that left them significantly behind others (Leswing). Currently, Intel does not have a GPU competitor to Nvidia, though they do have an AI chip that is not very popular. Manufacturing-wise, they do not outsource nearly as much as companies like Nvidia and AMD, furthering the delay of their products.

Based on the findings, it was evident that Nvidia, whose stock presented the most sustainable investment choice, was founded upon a sustainable platform, adapting to the needs of society and governmental demand. For example, the 2022 Biden Administration CHIPS and Science Act encouraged the increase in the production of GPUs, which are Nvidia's specialization. Moreover, Nvidia's GPUs are created with adaptable uses, such as electric vehicles and efficient medical imaging. These greater fields of transportation and healthcare are constantly growing; aligning the recent boom in AI with these fields was an excellent foundation for the success of Nvidia. Nvidia is an example of sustainable investing, as they have built their company upon societal needs and current innovation, which has proven to lead to their success and growth as a company.

Conclusion

As the world moves toward a more eco-friendly future, specific industries and business models are at risk because there will be a lack of demand. This was represented by Intel, in their declining performance over the past 6 months and prior. Staying ahead of trends, companies, like Nvidia, have greater EBA and reliable performance in coming quarters; this could be represented in a plethora of manners: sustainability measures, collaboratives, and innovative product usage. A brief analysis of a company's EBA can change the view of an investment from a long-term profit standpoint; investors' knowledge about these advantages is rare yet beyond useful in its impact on the greater world. Sustainable investing incentivizes companies to adapt their practices and investors to support the greater good of the world. Change is not binary, nor is investing; it is vital to explore the juxtaposition between the two when given the power of choice.

Fear: A Barrier to Honesty for Victims of Workplace Harassment

By Lakshmi Nakka

Introduction

More than half of all workers in the United States have reported experiencing some form of workplace harassment. Workplace harassment ranges from a wide range of inappropriate and unprofessional behavior, such as bullying, sexual harassment and more. Despite being treated unprofessionally and being disrespected, many victims never report or come forward with their experiences. Many victims continue to face harassment due to a lack of intervention, and have to suffer in the workplace, and many feel trapped and see no escape other than leaving their job. The painting *Confrontation on the Bridge* depicts the issue victims of workplace harassment feel everyday - they are being held back from moving on from harassment issues because they can't report it. Victims feel like they can't speak the truth about their experiences because of a plethora of barriers and risks that could be a result of speaking out about their experiences with harassment in the workplace. Raising awareness about the lack of effective protocol and acting to make it more impactful and effective is the key to building safer workplaces for everyone, and this is demonstrated through the examined stimulus sources. To address the daunting issue of workplace harassment, and how workplaces can be made a safer place, the following research question was investigated : "What barriers in the workplace prevent victims of workplace from speaking out about their experiences, and how can these barriers be broken?". The goal of this study was to examine the factors that prevent victims of workplace harassment from coming forward with their experiences.

Judgment From Coworkers

One barrier to reporting workplace harassment is judgment from coworkers and alienation in the workplace. A fear of not fitting in, and being judged by others causes victims to feel embarrassed about their experiences with workplace harassment. Suzanne Goldberg, a professor of law at Columbia University presents her findings, and essentially claims that fears of "a fear of being negatively judged by others, whether peers, supervisors, or human resources staff" is what causes low reporting rates for this issue. Goldberg's findings demonstrate that in workplaces, harassment and reporting are taboo topics that are often used to exclude or mistreat others. In addition, they show an underlying issue of unsupportive workplaces that make it hard to report any issues, whether or not they pertain to harassment. The fact that being harassed is considered taboo, and grounds for discrimination shows that workplace culture is toxic and does not encourage safe, healthy behavior practices. Subliminally, this ties into the novel *Through The Tunnel* by Doris Lessing, where a little boy puts himself through extreme physical pain in order to fit in with older boys. Keeping in the pain caused by harassment to fit in and conform with an accepted standard at the workplace is what causes unsafe environments. When employers encourage these things to happen: harassment continues, and may even increase, and it will likely never be resolved. This fear of sticking out and the taboo around workplace harassment

demonstrates that general workplace structure is set up in a way to isolate victims of workplace harassment. Rana M. Van Tanyul, a doctor of sociology and an expert on human relations argues that toxic workplace cultures that normalize not reporting incidents of harassment develop as a habit for many employees. Having to work in a place where it is abnormal to stick out and be different from the others makes it difficult for many people to want to deviate from the norm. This ties back into the idea that facing unwanted harassment is the victim's fault, and is something embarrassing. Cultures that normalize hiding our experiences and feelings are what create uncomfortable environments. In addition, they give perpetrators more confidence as they are aware of the lack of consequence. The sources provided show that fear can be the biggest blocking pathway from achieving our goals/desires, and in some cases, the desire is justice for inappropriate conduct in the workplace. Power structures, judgment and general toxic norms make it difficult and scary to speak up about harassment in the workplace. Taking the steps to destigmatize these experiences supports and empowers victims of harassment to speak up.

Power Structures

Many cases of workplace harassment involve inappropriate behavior from a more powerful employee, threatening a loss of job should the victim choose to report the experience. The threat of repercussions that can affect job security discourage employees from reporting incidents of harassment. Lily Zheng, a Stanford Educated researcher who focuses on creating safe workplaces, in an article for Harvard Business Review, found that many people don't report harassment because they fear repercussions. From an ethical perspective, blaming people for being victims of harassment to maintain social image and funding is dehumanizing, and demonstrates a lack of care for employees. In addition, having a workplace where people feel unsafe to be honest is a toxic, unsafe workplace. Judging an employee's potential because of their tendency to be honest about their experiences and preventing them from being honest promotes harassment, as it shows that the company really doesn't want to act upon it. In addition, these policies break multiple laws that prevent hiring/firing on the basis of discrimination - which categorizing victims of harassment is. Having to report harassment to managers, bosses, or even coworkers is difficult because many people simply don't care or are unwilling to act upon it due to fear of repercussions. In a publication about maintaining safe workplaces, the State of Vermont determined that many people felt discouraged because their coworkers and managers didn't make an effort to listen to them or understand their complaints. Creating a workplace culture that encourages people to be inconsiderate to each other, promotes isolation and shows that an expression of emotions is deemed unprofessional. Hiring managers that care about their employees and make genuine efforts to make a difference is the key to developing and maintaining healthy relationships in the workplace. Additionally, this removes the animosity about procedures to report harassment, and shows perpetrators that they will receive consequences. Incentivizing hiding complaints about workplace harassment, and creating isolated, emotionless workplaces trap victims of harassment in a cycle of harassment with no end. Workplace harassment impacts the lives of victims inside and outside the workplace.

Having no solution to overcoming workplace harassment other than moving jobs forces millions of people to endure painful experiences, and this greatly impacts their health.

Employer Motives

Political motives to uphold public relations have caused many employers to shut down concerns about workplace harassment. Employers try to convince employees that their concerns about harassment are invalid, and are figments of their imagination. Anna Brown, an experienced researcher at the non-partisan organization Pew Research found that many believe that people go “hundreds of powerful men lost their jobs or roles after accusers alleged that they had been victims of harassment or assault by these men in the workplace”. Losing multiple employees for something as serious as harassment impacts the funding of the company and its public presence. To mitigate this, many companies try to shut down claims about harassment to maintain public image. This is also done to avoid needing to fire employees as rehiring is a laborious process. Companies lack adequate policies to address harassment, causing an ignorance of the problems associated with it. Primary Jenny R. Yang is the Chairperson of the Equal Employment Opportunity Commission, who is experienced on how policies impact HR policies and responses to forms of discrimination, like harassment. In a study she found that “legal systems and doctrines have impeded workers’ access to the courts by enabling employers to write rules that undermine accountability”. By having minimal and inconsistent reporting structures, companies are able to evade facing the issue of harassment. They also often set policies that make them liable for such experiences in the workplace, and are backed up by the law. Employees with concerns are encouraged to file a court case, but that takes a lot of time, dedication and personal investment that not many people are ready to commit. Many argue that workplace harassment is exaggerated and not as serious as it seems.

Social Perception

Many people believe that workplace harassment is a myth and that victims lie about their experiences. Anna Brown, a researcher with the non-partisan organization Pew Research, found that many people said that people label small gestures as assault, making claims invalid. However, statistics have shown that almost 64% of people experience intense harassment and are too scared to even speak up about it. Workplace cultures make it hard to come forward about harassment, and cases of false accusations are rare compared to incidents of harassment. Many people believe that harassment training is a waste of time as it is common sense. An article by Forbes, a leading business magazine, found that many reported “Only a few individuals are the problem. Educating everyone is a waste of time”. This point is valid, because while many people in the workplace face harassment, it is often by the same 2 or 3 perpetrators. Forcing everyone to undergo training multiple times causes a higher disregard for the problem. It is difficult to force people to speak about their experiences and come forward with the truth no matter what system is set in place. However, changing the systems will make coming forward easier for the millions of victims.

Effects on Victims

Workplace harassment impacts the lives of victims inside and outside the workplace. Having no solution to overcoming workplace harassment other than moving jobs forces millions of people to endure painful experiences, and this greatly impacts their health. In a research article for the NIH a group of experienced researchers, led by Candice A. Shannon, a master in sociology, found that many people reported that experiences of harassment in the workplace led to significant mental health issues. Employees, who should be receiving benefits from their workplace are often led knee deep in serious mental health issues due to a lack of effective procedure to address harassment. Forcing employees to be trapped in a cycle of abuse with nobody to report their stories causes them to be isolated and feel alone in their experiences which can cause depression, anxiety and more. Having to face workplace harassment can cause job loss, as many employees feel like they need to quit. A study about workplace harassment conducted by tenured professors at the University of Massachusetts found that 64% of cases of sexual harassment lead to the victim quitting. Because responses to harassment are weak and ineffective, many have to endure harassment over long periods of time. This causes a significant mental and physical burden which greatly impacts comfort in the workplace. With no other solution, many victims feel compelled to quit their jobs as it is often their only way to avoid belittlement. Lack of adequate responses to workplace harassment causes many employees to endure significant mental burden. With almost no solutions and ways to address these issues, many quit their jobs and hope to find a safer workplace.

Conclusion

To conclude, workplace harassment is a serious issue that isn't being addressed seriously in workplaces. It is vital to change the system to protect employees from facing such harassment and to properly assist those who are being harassed. The solution to properly empowering employees to speak up about workplace harassment is to create a friendly environment and make reporting accessible and safe. Research however, has revealed that despite the effectiveness of these solutions, there are many factors that prevent employees from being confident in speaking about their experiences. Many feel like they will be looked down upon by others and lose their job even when that is not the case, others are manipulated into thinking that nothing ever happened to them. Normalizing talking about these issues and making workplaces humanistic is the only way to conquer workplace harassment.

Revisiting the Great Divergence Debates: How Scholars Examine the Great Divergence and its Relevance on Present-day Politics and Economics

By Yinzheng (Daniel) Feng

Abstract

The Great Divergence refers to a series of important events that led to the political and socioeconomic divergence of Europe and Asia over the course of the 19th and 20th centuries. There are two prevalent arguments among scholars as to why the Great Divergence occurred. One argument is represented by Harvard professor David Landes, who views that the Great Divergence happened as a result of the positive characteristics of the European people. The other argument is represented by Kenneth Pomeranz—a historian specializing in Chinese history and the person who coined the term ‘Great Divergence’—who contended that pre-divergence Eurasia was remarkably similar and that the opportune placement of certain resources in Europe led to the eventual divergence between the two regions. This paper first examines the relevance of the Great Divergence by comparing the differences between pre-industrial societies—especially sophisticated ones—and industrial societies, chiefly in terms of their economic characteristics. Then, the paper covers the arguments of Landes and Pomeranz before concluding with some thoughts on how the Great Divergence has impacted the world up to the present day. This paper argues that the Great Divergence debates are still relevant today as they continue to inform present-day geopolitical trends, including the present-day Sino-American rivalry.

Introduction

In the 18th century, a series of important events led to the divergence of Eurasian society, politics, and economies. This series of events is collectively known as ‘the Great Divergence’. Before the Great Divergence, living standards in Europe and Asia were astoundingly similar. For example, in terms of energy intake and nutrition, a person in China’s Yangtze Delta would receive around 1837 calories from rice. In contrast, a person from 19th-century Britain received anywhere between 1500 to 2400 calories from all foods (Allen et al. 24). The Great Divergence was a process that saw living standards shift in favor of a select few Western European countries like Britain. This divergence impacted the world in many ways, ultimately laying the foundation for Europe’s—and later America’s—extensive economic influence over the world. As a result, many scholars have examined The Great Divergence and its impact. Scholars have analyzed the Great Divergence in a number of ways, and have derived several different lessons and conclusions from it. This paper argues that the Great Divergence is not simply a premodern phenomenon, and is in fact still very relevant in the analysis of contemporary politics and economics. This paper investigates the scholarly debates on the Great Divergence and its relevance using the literature review method, deriving information from sources ranging from the works of scholars like David Landes, O’Rourke and Findlay, and Kenneth Pomeranz.

What is a Pre-Industrial Society?

In order to fully comprehend the scholarly debates over the Great Divergence, it is important to understand what came before an industrial society. A pre-industrial society is drastically different from the industrialized societies that rose after it. Author Patricia Crone observes that “Pre-industrial populations were small” (Crone 17). For example, an Oxford University study estimated that England and Wales had an estimated population of 4 million people, while a British government census shows that England and Wales fielded a population of 32 million individuals by 1900. In addition, Crone points out that pre-industrial cities “were either few or small, or both” (Crone 19). She points out that “even cities accommodating just one million people were rare” (Crone 52). In contrast, present-day Tokyo—the largest city in the industrialized world—houses nearly 40 million people.

However, there were certain pre-industrial societies that were quite complex. Crone distinguishes between simple and complex pre-industrial societies. From a political perspective, a complex pre-industrial society had an advanced social hierarchy. As a society continues to become more complex, the division of labor increases due to the more sophisticated needs that a complex society has to fulfill. Crone sets forth a thought experiment where a large group of people are stranded on an island. When a ruling class is established, “some of you would have to become administrators, and the rest of you would have to produce food on their behalf on top of everything else. But then you might find that you needed buildings for the quartering of the soldiers, the filing of administrative records, the storage of grain handed over, and so on” (Crone 4). This process repeats itself many times over and leads to more divisions of labor. As Crone points out, “all the subsequent changes were further divisions of labour: more and more people went into special occupations” (Crone 16). Additionally, an increasingly sophisticated society would have a developed religious system. From an economic perspective, a complex pre-industrial economy was a lot less efficient compared to post-industrial societies. A large percentage of the working population were agriculturalists. These practiced subsistence farming (i.e., producing just enough for one’s own subsistence), which kept their labor from impacting other sectors of the economy. In these complex pre-industrial societies, “there was not necessarily much of a market in agricultural produce” (Crone 25). Even if such a market existed, “it did not necessarily involve the peasants themselves, let alone to their advantage” (Crone 25). Agriculture was a central part of a complex pre-industrial economy, but productivity on the land was constrained by technology at that time. In contrast, post-industrial societies produce far higher crop yields through commercial farming methods and better technology. Pre-industrial cities acted more as centers of consumption than production, leading to Crone remarking that “those [cities] of the pre-industrial world often have a parasitical appearance” (Crone 21) compared to post-industrial cities. In terms of labor, the chief method was coercion, whether it is slavery, serfdom, corvée, or indentured servitude.

What was the Great Divergence?

The Great Divergence is a series of events that led to the divergence of political and socioeconomic pathways of Europe and Asia that ultimately led to the formation of a new world

order led by a select few European and American countries. Before that, however, European and Asian nations were very much alike.

Among these similarities was a swiftly burgeoning population. In China alone, “the population began to rise rapidly toward the several-hundred-million level” (De Bary et al. 172), while in Europe the “population doubled during the 18th century, from roughly 100 million to almost 200 million” (Kumar). Both regions were swiftly headed to an ecological death trap situation later known as the Malthusian trap. Chinese scholar-official Hong Liangji notes in his letter to Prince Cheng, the future Emperor Jiaqing, on “Imperial Malfeasance and China’s Population Problem” that “after a long period of peaceful rule, Heaven-and-earth...[as well as] the ruler and the ministers cannot stop the people from reproducing” (De Bary et al. 175). As a result, Hong Liangji is “worried about peaceful rule” and advocates for the “Migration of farmers to newly reclaimed land...[and] heavy taxes...reduced after a comparison is made between past and present tax rates” (De Bary et al. 175). Hong Liangji has successfully challenged the notion that “a growing population is an index of good government and is socially desirable” (De Bary et al. 172).

Meanwhile, Europe faced the same issue. Five years after Hong Liangji’s proposal to curb the Chinese population crisis, economist Thomas Malthus came up with the notion of the Malthusian trap. He states that “Population, when unchecked, increases in a geometrical ratio...[and that] Subsistence increases only in an arithmetical ratio” (Malthus 4). As a result of “This natural inequality of...population and...production in the earth”, Malthus concluded pessimistically that he sees “no way by which man can escape from the weight of this law which pervades all animated nature” (Malthus 5).

However, what set Europe’s situation apart from Asia’s was the Europeans’ colonies. Historian Kenneth Pomeranz remarks that “the significance of the Atlantic trade [was] not in terms of financial profits and capital accumulation, nor in terms of demand for manufactures...but in terms of how much they relieved the strain on Europe’s supply of what was truly scarce: land and energy” (Pomeranz 23). Conversely, China went on a cycle of reproduction that led to its population surge to 1.4 billion people in the present day.

Another point of divergence was coal. Europe and Asia both have an abundance of coal. In Europe, there were coal-rich regions like “Lancashire...and Northumberland” in Britain, “northern France”, as well as “the Ruhr area” and Prussia in what is now Germany (Cartwright ; Frassetto and Herlihy). In China, northwestern provinces like “the northwestern province of Shanxi...[and] Inner Mongolia” housed the “main coal deposits” of China (Pomeranz 64; Perdue). In Europe, the coal was wet and close to metropolitan areas, while Chinese coal was dry and far from the metropolitan areas down in the Yangtze Delta. The consequences were two-fold. First, the proximity of the coal to urban areas in England made it practical for “England’s turn to coal” (Pomeranz 23). As a result, coal became a crucial resource for facilitating industrialization. Also, the wetness of coal in Europe prompted the invention of the hydraulic pump, a crucial technology.

As a result of these two key divergences, Pomeranz asserts that “the turn of the nineteenth century [established that] the New World plus coal” enables industrialization to “remain sustainable for a prolonged period” (Pomeranz 16).

The Great Divergence Debates

Throughout the late 20th century, the dominant theory explaining the Great Divergence was the theory that Euro-Americans simply had better personality traits than Asians. The scholar that exemplifies this view is David Landes, a historian at Harvard University (Reuell).

In his article *Why Are We So Rich and They So Poor?*, Landes describes two reasons for Europe being more prosperous than Asia. One suggests that Europeans are richer because of positive reasons: “that is, we [Europeans] are hardworking, knowledgable...and productive, and they [Asians] are the reverse” (Landes 2). The other says that we are so rich because of negative reasons: “we [Europeans] are greedy, ruthless...[and] exploitative...while they [Asians] are weak, innocent...and vulnerable” (Landes 2). In history, there have been many ways of explaining prosperity. Adam Smith and David Ricardo represent a classical economic view, and both supported the notion of economic growth under the circumstances of free trade. Ricardo’s theory of comparative advantage suggests that if countries are better at producing certain commodities, they should specialize in those industries. For example, Ricardo compared England and Portugal to illustrate how each country could produce more total commodities if they traded openly, thus prospering more in the long run (Costinot and Donaldson 1). Then came Karl Marx, who supported the theory of natural growth but asserted that colonial exploitation was the cause of economic disparity between Europe and other countries. Marx argued that imperialist powers were deliberately preventing colonies from thriving. Landes’ article states that this theory has been disproved—economic growth is not natural. Asian countries that have tried to swiftly modernize have either failed disastrously or succeeded. All in all, Landes asserts that the Great Divergence happened largely due to the positive cultural characteristics attributed to the Europeans, including Europeans being “hardworking, knowledgable...and productive” (Landes 2).

In 2001, Kenneth Pomeranz’s *The Great Divergence* was published. In his book, he suggested an alternative argument, that Europe’s—especially England’s—meteoric rise to the global stage was mostly by chance, rather than cultural superiority. He challenges Landes’ conclusions using the method of “balanced comparisons” (Pomeranz 8). Using balanced comparisons, Pomeranz ended up with the conclusion that the sociopolitical and economic situations of both Europe and Asia—particularly China—were very much similar: both continents were descending into an ecological death trap. For example, in Peter Purdue’s review of *The Great Divergence*, he states that the “European demographic system” was viewed as a differentiating factor that influenced the Great Divergence (Purdue). Pomeranz found out that although Asian population growth was tremendous, “Asians (or at least east Asians) did have some control over marital fertility” (Pomeranz 41). For instance, Japan has “surprisingly low birthrates” which may have been a “result of customary arrangements in which young women

were employed away from their home villages” for a long period of time (Pomeranz 41). Chinese families also “employed a variety of strategies to limit their family size, space their children, and select their genders” between 1550-1850 (Pomeranz 41). Thus, Pomeranz proposed a new argument, that Europe’s rise to global dominance was rooted in the opportune placement of key natural resources like coal, and the extraction of resources from New World colonies.

A third point of view is offered by O’Rourke and Findlay, who discuss the long-term history of world trade. In their book *Power and Plenty*, they point out that free trade is crucial to economic growth. For example, Napoleon’s “Berlin Decree”, which prohibited “all trade in British goods...and stated that ships arriving directly from Britain or her colonies were to be barred from French ports” (Findlay and O’Rourke 367). This decree was eventually enforced in Napoleonic France’s zone of influence and allies. However, the consequences were immense. France’s “imports were down by slightly more than 50% during 1807–14” (Findlay and O’Rourke 369). Prices of commodities throughout Europe increased. For example, the price of pepper in France increased threefold between 1807 to 1814 (Findlay and O’Rourke 370). On the other hand, Britain—which began to actively encourage free trade—was only minimally affected (Findlay and O’Rourke 369). This example shows how free trade benefited economies and how the cessation of it hinders economic growth. Thus, powers like Britain were eager to protect and expand zones of free trade. In the nineteenth century, Britain and the US used a concept known as “gunboat diplomacy”, which is a form of diplomacy to “secure specific advantage from another state” using violence (Ghosh). Gunboat policy, for instance, was used in the First Opium War that sparked China’s “Century of Humiliation”. The notion of free trade was imposed on the Chinese by force and in a way that benefited the Western powers, partially because of the severe war reparations enforced on the Qing state and trade terms like low trade tariffs that were unfavorable to the Chinese. These measures rendered the Chinese government incapable of collecting enough tax revenue from the increase in trade, contributing to the weakening of the Chinese economy. Thus, O’Rourke and Findlay details how free trade fits into the Great Divergence.

Is the Great Divergence Still Relevant in the Present?

The Great Divergence is still relevant today because it drastically reshaped global politics and economics. As a result of the Great Divergence, it became very clear that the 19th century was going to be ‘The European Century’. In 1840, the First Opium War ended in a British victory, kickstarting China’s ‘Century of Humiliation’, a period where the country was “reduced to a semi-colonial...[and] semi-feudal society” (Embassy of the People's Republic of China in the Republic of Latvia). In 1858, “the last Mughal emperor surrendered to British East India Company forces”, ending the Mughal Empire (Mahajan 2). In 1862, the Treaty of Saigon created the predecessor to the French colony of Indochina. All in all, the Great Divergence led to a few European nations and America dominating the world order at that time. This phenomenon would continue into the 20th century.

This shift in global politics had serious consequences. For example, people in China—which was still reeling from the after-effects of the First Opium War—desired change. As Xi Jinping claimed in 2021, “national rejuvenation has been the greatest dream of the Chinese people and the Chinese nation [since the Opium Wars]” (Embassy of the People's Republic of China in the Republic of Latvia). This sentiment was reflected by the nineteenth-century Chinese poet Gong Zizhen, as he described the pitiful state of Chinese bureaucracy shortly before the First Opium War and his ardent desire for change:

*“All life in China's nine regions depends on the thundering storm,
thousands of horses all struck dumb is deplorable indeed.
I urge the Lord of Heaven to shake us up again
and grant us human talent not bound to a single kind.”*
(Owen 1147)

For some people, imported Western ideologies—whether it is *laissez-faire* capitalism or Marxism—offered a medium for change. In the late 19th and early 20th centuries, China started a process of modernization, which included sending students to Western countries to study abroad. Some of these people became key leaders of the Republic of China, including Sun Yat-sen and Chiang Kai-shek.

Meanwhile, the Marxist notion from *The Communist Manifesto* that “The proletarians have nothing to lose but their chains” and that “They have a world to win” was winning wide support among the lower classes of early 20th-century China (Marx and Engels 32). The formation of the Chinese Communist Party took place in 1921 and the party assumed control of mainland China in 1949. Thus, the Great Divergence has impacted global history for at least two hundred years.

The Great Divergence also impacts present-day geopolitics. As China walks out of its ‘Century of Humiliation’, it starts to catch up to America, ultimately entering an technological arms race with the superpower. The struggle over determining dynamics of trade, as explained by O’Rourke and Findlay, continued in the Trump administration’s economic policy-making and its trade war with China. In addition, Chris Miller—the author of *Chip War*—notes that “As China and the United States struggle for supremacy, both Washington and Beijing are fixated on controlling the future of computing” (Miller 23). Miller continues to expound that “The rivalry between the United States and China may well be determined by computing power”. Policy-makers in both China and America now realize that most (if not all) of advanced consumer and military technology is dependent on cutting-edge chips (Miller 22). This crucial technology depends on the island of Taiwan, an informal ally of the US which “Beijing considers a renegade province” (Miller 23). The results of the Chinese Civil War can be considered a residual effect of the Great Divergence because the long-term economic weakening of China relative to Europe contributed to a divisive, drawn-out, and violent revolution. These geopolitical and technological tensions between China and the US were thus in part shaped by the outcomes of the Great Divergence.

This paper highlights how significantly the Great Divergence has impacted modern history. In tracing Western Europe's industrial transition, scholars have proposed different reasons for Europe's industrial lead over the nineteenth century. Landes concludes that the Great Divergence occurred because of the positive characteristics of European society and culture, while Pomeranz proposes that the Great Divergence occurred more as a product of the opportune placement of natural resources like coal, and European control over the New World. The Great Divergence and the notion of a "century of humiliation" continues to play an important role in official Chinese state communications, thus affecting contemporary geopolitics profoundly, as can be seen in increasing Sino-American rivalry and Xi Jinping's "Chinese Dream".

How do the Nutritional Benefits Associated With Diverse Diets, Like the Mediterranean Diet and Farm-to-Table Diets, Negate the Effects of Alzheimer's Disease?

By Liam Sweeney

Abstract

Recent findings about how the nutritional benefits associated with diverse diets, like the Mediterranean diet and farm-to-table produce, create pathways that protect against cognitive decline. This paper will touch on these findings, as well as look into these diets' ingredients and how they might contribute to the onset of and protection against Alzheimer's disease development and pathology, vitamins and minerals and how they contribute to increased or decreased risk of Alzheimer's disease, and juice's impact on cognition and Alzheimer's disease, to name a few. While there is no cure for Alzheimer's disease, that doesn't mean it can't be prevented or controlled. This paper explores convenient (and healthy!) meals and diets that are proven to work in alleviating Alzheimer's disease progression. This review spans diverse demographics, focusing especially on older adults prone to cognitive impairment. This research will focus on healthy eating practices that can be incorporated into daily life, identifying foods and diets that successfully mitigate Alzheimer's disease. A central takeaway from the present review is that a feasible approach to Alzheimer's disease prevention is eating nutrient-dense foods, which individuals can easily find in Mediterranean and farm-to-table diets.

Introduction

Every 65 seconds someone in the United States develops Alzheimer's disease (AD) (UsAgainstAlzheimer's), meaning out of the approximately 340 million people living in the U.S., 5.7 million have developed AD; however, this small statistic changes 100% of these people's lives. Although AD devastates the lives of millions of people worldwide and is the seventh leading cause of death in the United States (National Institute on Aging), there is no cure. Given this prevalence, exploring modifiable factors, such as diet, is critical. The phrase 'eat the rainbow' carries significant weight, as a diet rich in diverse nutrients directly benefits cognition (Agarwal et al. e2260). Research has suggested that there are benefits to eating diverse diets like the Mediterranean and farm-to-table diets, both of which are plentiful in fruits, vegetables, oils, whole grains, fish, and beans (Agarwal et al. e2260). Consumption of these foods is directly related to cognitive protection as an individual ages and their brain becomes more vulnerable to AD (Agarwal et al. e2259). That is why it is important to understand how the nutritional benefits associated with diverse diets, like the Mediterranean diet and farm-to-table diets, negate the effects of AD. This review paper will look at these diets and their nutritional value, as well as how they can influence overall cognitive function and contribute to the progression of cognitive decline.

What is AD

Despite very little being known about AD, scientists have known of its existence for over a century. Inheriting its name from Dr. Alois Alzheimer, AD was first diagnosed in 1906 after Alois observed changes in the brain of a woman who was thought to have died from a mental illness (National Institute on Aging). In simple terms, AD is a degenerative brain disorder that over time inhibits memory and brain power, eventually hindering one's ability to perform basic tasks: all of which were symptoms the woman was experiencing (National Institute on Aging). However, to categorize all cases of memory loss as Alzheimer's is illogical, and there are many requirements that one must have before being diagnosed with AD. In general, there are two types of cognitive syndromes: mild neurocognitive impairment and major neurocognitive impairment. According to the Diagnostic and Statistical Manual of Mental Disorders (DSM-5) (American Psychiatric Association), someone with mild neurocognitive impairment may experience some cognitive decline but can still carry out basic activities and navigate an unassisted lifestyle. Meanwhile, major neurocognitive impairment is a more severe type of cognitive decline that is not caused by any underlying disorders and impedes daily functioning (Apostolova 421-422). While these are the diagnostic standards for AD, it is important to remember that not all impairment looks the same in everyone and that it is a really complex disorder in both its presentation and etiology. In very rare cases, AD can develop in people at a much younger age (i.e., early-onset AD), however it most commonly affects older adults. More specifically, 10-30% of people over the age of 65y develop AD, but the vast majority of cases (i.e., over 95%) occur in individuals between the ages of 80-90y (Masters et al. 1). In addition to these groups, when factoring in diet, these numbers become even more pronounced, with specific foods impacting the brain's ability to think and remember.

Evaluating the Concept

Although there is no cure for AD, studies have shown that the foods one eats play a role in cognitive-decline. In order to understand why eating healthy is important for brain health, it is important to consider that the brain is plastic. Neuroplasticity refers to the biological ability of the brain that can reorganize its structure in response to the rapidly evolving environment we live in (Cramer et al. 1592). The hippocampus, which has long been considered a classic model for the study of neuroplasticity, plays a crucial role in learning, as well as in the storage and consolidation of memories (Bartsch & Wulff 1). Just like the rest of the body, the brain needs nutrients to allow for complex biological mechanisms like neuroplasticity. As a result, eating unhealthy foods that lack key dietary components can reduce neuroplasticity and without it, there will be reductions in the birth of new neurons, eventually hindering learning and overall cognitive function (Ryan).

How the Mediterranean Diet Affects AD

While many diets offer unique benefits, when it comes to combating cognitive decline there are two that are particularly effective. The Mediterranean diet (MedDiet) is a predominantly plant-based diet packed with nutrients crucial for brain health ("MIND and

Mediterranean diets linked to fewer signs of Alzheimer's brain pathology"). Typically practiced in Italy and Greece, though many other countries have adopted this way of eating (Davis et al. 9139), people who follow the MedDiet consume fruits, vegetables, nuts, fish, legumes, olive oil, whole grains, and even small amounts of wine ("MIND and Mediterranean diets linked to fewer signs of Alzheimer's brain pathology").

As mentioned before, AD is a degenerative brain disorder that over time inhibits memory and brain power, eventually hindering one's ability to perform basic tasks ("Alzheimer's Disease Fact Sheet). But, what exactly happens to the brain in order for this to occur? Presently, scientists believe that one of main features of AD are unusual clumps of proteins which create amyloid plaques and tau tangles (National Institute on Aging). Fortunately, these abnormalities can be reduced with the help of a few lifestyle changes, one of them being the MedDiet.

A recent study done by researchers at Rush University Medical Center investigated diets such as the MedDiet and their connection to brain changes associated with AD. For more than ten years, 581 participants (average age = 84y) completed questionnaires about the food they ate on a daily basis. Using that information, the researchers "scored" each participant's diet and higher scores were given to individuals who more closely followed diets like the MedDiet. This study concluded that participants with higher diet scores had lower levels of amyloid plaques and tau tangles postmortem, meaning their brains showed fewer signs of AD pathology (Agarwal et al. e2260, e2262, e2264; "MIND and Mediterranean diets linked to fewer signs of Alzheimer's brain pathology"). Unlike many other diets, due to the plethora of nutrients found in the foods which these people were eating such as omega-3 fatty acids and antioxidants, their bodies were able to produce nontoxic fragments to prevent the formation of amyloid plaques and tau tangles and reduce the amino acids that they are made from (Jicha & Markesbery 49).

How Farm-to-Table Diet Affects AD

Another diet that has proven very effective in protecting against AD is the farm-to-table diet. This diet mainly refers to produce and livestock that come from local farms and organizations. Similar to the Mediterranean diet, farm-to-table diets consist of many of the same foods and may offer protection against a number of chronic diseases due to its nutritional value. With that being said, one advantage of the farm-to-table diet is its accessibility; it offers a more convenient path to healthy eating since anyone can start their own garden, and there are plenty of resources people can use to eat healthy. See the following link for more information: <https://www.opentable.org/>.

Vitamins and Minerals and How They Contribute to Risk For and Protection Against AD Development and Pathology

These diets are effective due to their high vitamin content, which supports brain health. Vitamins are the tiny but mighty nutrients that power our bodies, fueling everything from energy production to brain function, helping us stay healthy. One vitamin that both the MedDiet and farm-to-table diet are high in is vitamin B. Some vitamin-B rich foods in both of these diets are

fish, leafy greens, and nuts (McCulloch). Vitamin B is beneficial in many ways, but one of its main benefits is that it increases oxidative metabolism and thus reduces neural inflammation and oxidative stress (Ford et al. 9), which both play a role in the development of AD (Cleveland Clinic). It is important to eat foods packed with vitamins such as vitamin B in order to prevent the damage of brain tissue from occurring in the first place, because by the time AD symptoms appear, it is possible that the disease has advanced to a stage where treatment is no longer an option (Ahmed et al. 1). Another vitamin that is important when it comes to preventing AD development is vitamin A. While vitamin A can be found in many of the same foods as vitamin B, it is most commonly found in fat-soluble foods such as liver, milk, and sweet potatoes, to name a few (Arnarson). Vitamin A and its derivatives, known as retinoids, play a crucial role in several cellular processes in the brain. For example, they help release neurotransmitters, control neuronal differentiation, and increase long-term potentiation (Grimm et al. 3). In other words, vitamin A improves learning and memory, ultimately decreasing cognitive decline (Olson & Mello 491). Lastly, vitamin E has proven to be beneficial in AD. Found in almost all naturally occurring oils, as well as hearty vegetables like red bell peppers, vitamin E is amazing at protecting neurons and preventing inflammation. In fact, the plasma of patients with AD and MCI is shown to have significantly lowered vitamin E levels, whereas a higher prevalence of vitamin E within the body has shown a reduced risk of AD (“Vitamin E”).

Fruit and Vegetable Juice

While it can be challenging to maintain a nutrient-rich diet, juicing provides a convenient alternative. Research demonstrates that juicing can protect against AD. A recent epidemiological study examining the relationship between cognitive performance and fruit, vegetable, and juice consumption suggests that juicing can be helpful when it comes to consuming vitamins that protect against AD (Lamport et al. 774). Dai and colleagues (751) sampled from a group of 1,589 Japanese Americans (54.4% female; average age 72y at baseline). Each participant filled out a survey measuring fruit juice and vegetable juice intakes high in vitamins such as vitamin B, vitamin C, and beta-carotene. The results indicated that 63 participants (4%) developed AD and consuming fruit/vegetable juices one to two times per week, or three or more times per week, was significantly associated with lower incidence of AD relative to consuming juice less than once per week (Dai et al. 751). If making juice at home is not an option for some people, similar benefits can be gleaned from store-bought juice. Another finding from the same study analyzed eight males and four females (mean age 78y) who all scored mild impairment on the Clinical Dementia Rating scale. Each individual consumed 6-9 mL/kg of Welch’s grape juice three times a day for 12 weeks. At the end of the experiment, each participant was found to have significantly better verbal memory acquisition (CVLT) than before (Dai et al. 730). These studies highlight the significant benefits of fruit and vegetable juice, even for individuals already experiencing MCI. The surplus of vitamins and antioxidants found in these juices not only supports overall well-being but also serves as a protective measure against age-related cognitive decline. As research continues to uncover the positive effects of fruit and vegetable juice,

integrating them into daily routines proves to be a simple yet effective strategy for promoting long-term brain health.

Conclusion

The connection between diet and brain health, though critically important, is often overlooked and needs to be taken more seriously. Studies have shown that specific dietary routes, such as the Mediterranean diet and farm-to-table diets, which are both rich in a multitude of vitamins, can be easily implemented into everyday life in order to prevent memory loss. In contrast, eating poorly can impair cognitive function and increase the likelihood of the development of AD. This is why researching the nutritional benefits associated with diverse diets, like the Mediterranean diet and farm-to-table diets, and how they negate the effects of AD, is crucial in improving public health. Without memory, one's quality of life is significantly impacted. The harsh reality is that everyone's memory will deteriorate at some point, affecting not only an individual's life but the lives of those around them too. Though AD remains a challenging disease, adopting nutrient-rich diets offers potential for delaying cognitive decline, underscoring the importance of dietary mindfulness in fostering long-term brain health.

Brain Computer-Interfaces: For or Against Humanity By Ondine Goedhuis

Brain-computer interfaces (BCIs) were developed in the late 20th century as computer systems that use inputs from brain signals to command a device in the user's external environment. BCI technology may have a powerful impact on the lives of individuals with disabilities that inhibit their movement or communication; users have the opportunity to interact with their physical environment and community through these assistive devices¹. However, as BCIs emerge as one of the key tools of the biotechnology revolution, they raise an onslaught of ethical considerations. This paper addresses the benefits and harms of BCIs under the lens of therapy and enhancement, using the work of Immanuel Kant and Francis Fukuyama as primary guiding philosophical theories. The paper focuses on the positive and negative effects of BCI use on personhood, autonomy, and human dignity. This paper argues that while BCIs have the therapeutic potential to bring those with disabilities closer in touch with their humanity, they threaten to undermine the human rights and dignity essential to a functioning society if used extensively for enhancement.

In enabling individuals with disabilities to interact with society normally, BCIs may aid in restoring their personhood. Disorders such as autism and Parkinsons can inhibit natural communication and movement, while mental health issues can cause disruptions to "normal" emotional consistency. A loss of the ability to communicate can impact one's social connection to others, which is crucial to a sense of personhood². Similarly, restricted movement and emotional instability can threaten one's sense of self and humanity. BCIs allow users with movement impairments to interact with their physical environment, enabling a restoration of normal human function. For example, MIT researchers recently developed a surgical intervention called the agonist-antagonist myoneural interface (AMI), which allows users to control prosthetic limbs through their nervous system. The neuroprosthetic interface produces electrical signals that send feedback to a prosthetic limb, so users can adjust their gait accordingly and display a natural range of movement. Furthermore, users with limited ability to speak may be empowered to communicate with others through BCIs, and ultimately feel more connected to their community and selves. In this way, the benefits of BCIs for therapy use may be significant in aiding those who are already disconnected from their personhood due to their disabilities.

BCIs also have the potential to enhance the human dignity of those with disabilities through increased autonomy. Kant considered moral agency – the ability to set one's means in accordance to moral law – crucial to how he defined humanity. Disorders such as autism, Parkinsons, "amyotrophic lateral sclerosis, spinal cord injury, [and] stroke," that often inhibit "motor and communication abilities," may undermine the autonomy of a person by preventing

them from acting in accordance with their desires³. BCIs have helped many achieve increased autonomy through giving them control over their environment and communication; a former user of BCI explained, “I felt like I could do anything...I could drive, I could see people, I was more capable of making good decisions – not bad decisions.”⁴ As Kant believes that this autonomy is fundamental to the “intrinsic worth” and “dignity of human nature,”⁵ one could claim that BCIs reinforce the dignity and humanity of those with disabilities who lack autonomy without the assistance of technology.

However, despite its potential to increase authentic personhood in disabled individuals, BCIs can result in adverse, counterproductive effects to personhood by blurring the line between a user’s authentic self and the machine’s influence as an extension of their body. For example, BCIs in the form of a “closed-loop deep brain stimulation (DBS)” can be used to treat depression and other mental health issues. Electrodes are implanted in a patient’s brain to pick up on shifts in their mood and alter the mental state of the patient accordingly.⁶ DBS is largely considered to be a form of therapy for those with mental health disorders. However, one might argue that, if a patient experiences a negative emotion that is context-appropriate – i.e., sadness at a funeral – the effort of the BCI to “correct” their mental state to a positive feeling is not one of therapy but of enhancement: allowing the patient to experience purely positive emotions rather than the natural range of human emotions that is considered normal. With this process arises the issue of whether such technology will affect a patient’s sense of identity and self. If their feelings are not their own and instead curated by technology, they might not be able to decipher whether their thoughts and actions are the BCI’s or their own; it is in this way that this technology may undermine their sense of identity.

Authentic personhood is essential both to individual satisfaction and to how humans connect with each other on a larger scale. Robert Nozick’s experience machine and the results from Hindriks and Douven’s experiment on theoretical pills is a prime example of the value the majority of people assign to authenticity. Hindriks and Douven compared the results of two pills; the functioning pill, which would primarily improve the quality of a user’s cognitive and physical abilities, preserves a sense of identity more effectively compared to the experience pill, which might disrupt a user’s perception of who they are in relation to their environment. As Hindriks and Douven predicted, out of the participants in their experiment, a much higher percentage were open to taking the functioning pill compared to the percentage willing to take

the experience pill.⁷ This data illustrates how greatly participants valued living an authentic experience. Moreover, Fukuyama argues against the eradication of natural emotions and identities, claiming that “our ability to experience these emotions is what connects us potentially to all other human beings, both living and dead.” In this way, personhood and authenticity are not only valuable to individuals themselves but also to how humans connect to others; once BCIs cross into enhancement territory, cautionary measures must be taken so that they do not undermine human identity and personhood.

As with personhood, the autonomy of users is likely to be challenged if BCIs are used for excessive enhancement. Autonomy becomes an ethical concern of BCI devices when users are “passively out of the decision loop” and stimulations from implanted devices occur without their influence: for example, DBS producing emotional responses in patients.⁸ When machines take partial control over a user’s actions or thought processes, they risk imposing on free will. Though there is much debate about whether free will exists, Calum MacKellar in his *Cyborg Mind* argues that the concept of free will is essential to democracy and a “civilized society.”⁹ Without some understanding of how humans make their own independent decisions, the meaning of voting, love, and interactions with others would be diminished. Furthermore, the aversion many have to being compared to “zombies” or “robots” illustrates how much humans value making their own decisions and not being determined by any other force. As mentioned previously, BCIs have the potential to increase autonomy in individuals that initially lack autonomy, allowing them to act according to their desires. However, when BCIs extend past therapy purposes, enhancing capabilities beyond the normal human capacity, the machine often has more control than the person using it. For instance, the concept of DBS for treating mental health issues is freeing until the user is automatically fed positive emotions where it is appropriate to feel sad, and the user’s autonomy is undermined. The patient simply wanted to be free of their condition, and did not ask for nor consent to being made “happy” all the time. As BCIs extend their uses past therapy, they pose a threat to the user’s sense of their actions being their own, as well as the concept of free will to society.

As a result of their impact on autonomy, BCIs challenge current approaches to legal and moral responsibility. If a user’s autonomy is undermined by an implant or device, they may no longer be expected to hold accountability for their actions. For example, detached assistive devices such as robotic arms are not connected to the user’s body; therefore, if the user performs an illegal action through the device, the legal system must decide whether the BCI or the

individual is held responsible.¹⁰ Another instance of legal confusion as a result of new technology arises with Robotic Autonomous Systems (RAS) in military technology; accountability becomes harder to establish as machines assume greater control in decision-making and combat.¹¹ This ambiguity of responsibility, one may argue, provides an opportunity for users to take advantage of BCIs to act immorally without facing consequences. Even without legal considerations, if humans are seen as robots as opposed to autonomous beings, individuals may no longer feel obligated to act morally toward each other because they no longer feel that their bodies and actions are fully their own. If BCIs begin to be used as enhancement tools by the majority, a lack of autonomy may lead to a deconstruction of responsibility; to an extreme, a society of shameless harm may arise as individuals lose their moral conscience.

An increasing use of BCIs may gradually change perspectives on disability and normality as enhancement becomes the new norm. BCIs that regulate mood through DBS, for example, depend on established norms about emotions and emotional variance. Some disability advocates, however, have argued that disabilities are often socially constructed and only harmful to the affected individual due to “inhospitable environments” rather than the condition itself.¹² There is a concern, therefore, that as BCIs begin to be used for enhancement purposes, the standard of normal will adapt to the technology, and the range of traits and conditions society perceives as disabled will increase. Individuals with disabilities, according to Wolbring and Diep, may be held to “ability expectations” due to a growing use of BCI devices. In this way, BCIs may also increase stigma for those who choose not to “fix” their condition with technology.¹³ However, the pressure to use BCIs may not be limited to those with disabilities; with shifts towards enhancement, humans functioning at a normal level will likely feel expected to receive the newest BCI implants in order to improve their abilities or master their emotions past a normal human capacity. As the standard shifts, society will experience an overwhelming pressure to keep up with the new normal.

If the human standard changes and enhancement becomes the norm, BCIs will risk intervening with the foundations of human nature. Kant’s emphasis on rationality as the basis of human dignity and nature falls short in that it neglects the emotional aspects of being human. A machine can be programmed to be rational and thus help a disabled individual think and act appropriately. However, a machine with a high level of rational thought is not necessarily

equivalent to a human being.¹⁴ Fukuyama strongly disagrees with an algorithmic, reductionist definition of humanity, claiming that “we are social and political animals not merely because we are capable of game-theoretic reason, but because we are endowed with certain social emotions.”¹⁵ To Fukuyama, natural emotional responses and the capacity to feel a range of authentic emotions are crucial to human nature. BCIs can never emulate natural human feeling, and it is in this regard that machine capacity falls short. If BCIs are normalized as a means of enhancing normal human function, machines may start serving as unsatisfactory replacements for authentic human qualities: “genius, or ambition, or sheer diversity” are Fukuyama’s examples of such qualities. Empirical data also stands in support of Fukuyama’s argument: When interviewed, BCI users were uncomfortable with the concept of being part-cyborg. There are concerns that BCI influence could become so large that humans may evolve into a different species completely, a species adapted by technology.¹⁶ Ultimately, as BCIs advance, it is important that society does not lose the emotions and natural inclinations that are prudent to human nature.

Crucially, human nature is the basis of human rights and dignity; thus, if BCIs undermine human nature, they risk moving society even further away from humanity. According to Fukuyama, many of the rights acknowledged today are grounded in observations of how humans are “by nature”; for example, equality and reproductive freedom. An appreciation for human nature is also essential to the concept of dignity. Fukuyama considers “Factor X” the essence of all human beings that guarantees an inherent dignity dependent on human nature. Similar to Fukuyama, the President’s Council on Bioethics discusses dignity as the factor that separates humans from animals. He explains that animals have no concept of responsibility to each other, and thus lack a sense of shared values or justice amongst themselves. Humans, on the other hand, understand each other as sharing a common dignity, and thus have a moral responsibility to respect this dignity in others.¹⁷ BCIs, like genetic engineering, have the potential to become the kind of “self-modification” Fukuyama warns against, a disruption to human nature and “thereby the human rights that are based on it.” As a result, society may enter a “post-human future” and lose the basis of human dignity to guide how individuals treat each other. This harmful modification of human nature is significantly more likely to occur as BCIs shift from being primarily assistive devices for people with disabilities to an opportunity for any average person to enhance themselves.

As with every advancement in the biotechnology revolution, the benefits of BCIs are intertwined with the harms. BCIs have the potential to both enhance and oppress human nature and dignity. In order for the benefits to outweigh the harms, one must approach BCIs with the preservation of humanity in mind. It may prove helpful to use a boundary between therapy and enhancement when considering the ethics of BCIs. As BCI uses lean towards enhancement, this new technology poses more of a threat to personhood, autonomy, and humanity. Ultimately, the boundaries placed on BCIs must ensure that the machines are empowering our humanity rather than suppressing it.

Brain-Body Connection of Chronic Drug Abuse By Marine Sevel

Abstract

Opioids have a longstanding history in medicine and are also the subject of the ongoing substance abuse epidemic in the United States. In addition to strong analgesic (pain-relief) properties, synthetic opioids also have high addiction potential and their long-term abuse can result in fatal outcomes. The mechanisms and outcomes associated with the long-term abuse of synthetic opioids involve both the body and mind. In this review article, key organ systems and brain areas affected by long-term opioid use are summarized. Additionally, possible mechanisms that underlie the effects mediated by long-term opioid abuse are included. Lastly, this review article provides an overview of interventional approaches under current investigation for the treatment and management of opioid use disorders. It is important research on opioids is continued to better help those suffering from opioid use disorders.

Introduction

Opioids have been used for thousands of years as a medication to relieve pain from wounds and injuries. In the 18th century, opioids were used as anesthetics. They were used in large numbers on the battlefield of the civil war in the U.S., due to opium's ability to quickly relieve a gunshot wound's pain. The influx of soldiers prescribed opioids for pain largely resulted in an opioid epidemic and the death of thousands (Boysen et al., 2023). Later in the 19th century, a spike in the prescription of opioids led the number of overdose deaths in the U.S. to increase dramatically. Since then, over 500,000 people have overdosed due to opioids and died in the United States alone (Federal Communications Commissions). Another layer of complexity is added to the epidemic with polysubstance use in efforts to balance, counteract, or potentiate the effects of another high.

What is important to note about opioids are their binding affinity and their potency. Opioids have a high affinity for the receptors they bind to which include mu-opioid receptors (MORs), delta opioid receptors (DORs), and kappa opioid receptors (KORs). These are known as GPCRs, or G-protein coupled receptors and are found everywhere in the body but mostly in the brain and the respiratory system. When a person takes opioids, the opioids bind to these opioid receptors within the body. Most commonly, they will bind to MORs. Activation of this type of receptor sends descending inhibitory impulses which decreases the transmission of pain from the periphery to the central nervous system, effectively causing analgesia (Dhaliwal A, Gupta M. 2023). Furthermore, activation of MORs results in a discontinuance of GABA (Gamma-aminobutyric acid) secretion. VTA (ventral tegmental area) GABA neurons specifically influences the release of dopamine in the brain, thus when less GABA is put out in the brain, there is an influx of dopamine leading to a euphoric sensation or a high.

The brain contains natural opioid-like molecules (endogenous opioids), that work on the same receptor systems as synthetic opioids. One major difference between endogenous and synthetic opioids is the dopaminergic release caused by each substance, where the former leads

to a significantly smaller amount than that of a synthetic drug. The constant intake of synthetic opioids leads to the output of dopamine, eventually leading to a phenomenon called tolerance. As tolerance builds, the need for a larger quantity of synthetic opioids appears, and eventually an addiction is formed.

Besides the aforementioned analgesic effects of opioids, the presence of opioid receptors in other areas of the body causes other adverse effects. The chronic use of synthetic opioids leads to respiratory depression, constipation, hypotension, endocrine abnormalities, anti-diuretic hormone (ADH) secretion from the posterior pituitary, and immune dysfunction in the body. These effects of opioids have been studied, but they still have large pieces of information about them missing. Similarly, there are still many questions remaining regarding opioids' effects on the brain and mind. Currently, it is known that chronic opioid use weakens GABAergic inhibition of VTA DA neurons. Decreases in dendritic branching as well as spine density in NA MSNs (nucleus accumbens's medium spiny neurons) and mPFC (medial prefrontal cortex) pyramidal cells also occur. These lead to impairments in the brain and its functions. In short, opioids can lead to permanent brain damage with irreversible effects on one's behavioral ability to function properly in response to cognitive stimulation.

The purpose of this study is to investigate the brain-body effects of opioids and their potentially lethal effects under chronic use. Here, specific organ systems within the body are reviewed, as well as specific brain areas affected by chronic opioid use. Moreover, an additional review of the effects of chronic cannabis use on the same central nervous system (CNS) structures is provided to issue additional details on the abuse potential of opioids relative to other substances of abuse.

Cardiac Effects

While uncommon, chronic opioid usage does lead to various adverse effects in the cardiovascular system. Intake of morphine may lead to immoderate levels of histamine release, thus leading to vasodilation and hypotension (Benyamin et al., 2008). This effect can be partially blocked by an H1 antagonist, a class of drug blocking histamine's attachment to H1 receptors, and can be completely reversed by naloxone (Benyamin et al., 2008). Notably, only mu, delta, and kappa receptors are present in the heart (Zimlichman et al., 1996) (Headrick et al., 2015). Opioid use can also increase parasympathetic cardiac activity and bradycardia (Benyamin et al., 2008). The mechanisms for this effect are unclear, however one study provided a possible explanation. This study on rats used immunolabeling methods and found that MORs are located postsynaptically on premotor cardiac parasympathetic nucleus ambiguus (PCPNA) neurons, which are a subset of neurons in the nucleus ambiguus that control cardiac function (Irnatén et al., 2003). Seventy-eight percent of dendrites and the whole of the perikarya of PCPNA neurons housed MORs. The same study also found that the activation of MORs inhibited voltage-gated calcium currents in PCPNA neurons (Irnatén et al., 2003). Specifically, the MOR agonist endomorphin-1 elicited this effect rather than the MOR agonist endomorphin-2. The two agonists are differentiated by only one amino acid in their amino acid sequence (Geraciotti et al.,

2009). The calcium currents in question were mostly made up of omega agatoxin-sensitive P/Q type voltage-gated calcium currents. The study concludes it is possible that the inhibition of these calcium currents may indirectly encourage activity of PCPNA neurons through disinhibition. In other words, the less active calcium currents indirectly caused an increase in nucleus ambiguus neurons. This slowed the rats' heart rate. It is possible the same mechanism is what causes slowed heart rates in humans following opioid consumption.

Methadone (a type of opioid) was also found to block the ether-a-go-go-related-gene (hERG) channel in humans, which encodes the potassium channel IKr (Benyamin et al., 2008). This block causes a prolonged QT interval, and can thus lead to torsades de pointes (TdP), a change in the heart's rhythm known as ventricular tachycardia (Cohagan & Brandis, 2024). As reported by the FDA, between 1969 and 2002 there were 59 cases of methadone-induced long QT syndrome (LQTS) or Tdp (Del Rosario et al., 2010). Tachycardia-correct QT prolongation (QTc) was also found to be caused by methadone, as it prolongs the cardiac action potential through inhibition of cardiac potassium channels (Benyamin et al., 2008). QTc greater than 500 milliseconds is generally associated with twice the increased risk of TdP (Li & Ramos, 2017). In a group of heroin addicts who were being treated with methadone, 16% developed prolonged QTc. Of that group, 3.5% experienced TdP (Benyamin et al., 2008). Review of data concluded QTc prolongation in significant patients was found in those taking a total daily dose of more than 30 mg of methadone. TdP on the other hand was observed in those taking 40-120 mg of methadone. In these studies, a significant correlation between QTc and the addition of CYP3A4 inhibitors like fluoxetine and clarithromycin to methadone treatments (Benyamin et al., 2008). In yet another study of seventeen patients receiving methadone who developed TdP, the mean daily dose was 397 +/- 283 mg, a higher average than the previous study (Krantz et al., 2002). Fourteen of those patients had a predisposing risk factor for arrhythmia. In conclusion, high dose methadone increases the likelihood of developing TdP, especially in those with predisposing risk factors. Treatment of drug-induced QT prolongation includes removal of the administration of the drug causing QT prolongation and looking into alternate treatment methods (Li & Ramos, 2017). If TdP fails to be prevented, direct-current cardioversion (DCCV) may be needed (Li & Ramos, 2017).

In line with the aforementioned effects of opioid usage, it is generally understood that heart function decreases as a function of chronic opioid usage. There is a strong correlation between the use of opioids and a dangerous drop in heart rate and blood pressure. A pattern is also present in the use of high doses of opioids and QTc and TdP which can be fatal. Due to the discovery of MORs on cardiac neurons, it is possible there are many more adverse effects of opioids on the heart that have not yet been identified.

Gastrointestinal Effects

Gastrointestinal effects of opioid use are pervasive. The most frequent effects include constipation, nausea, vomiting, and narcotic bowel syndrome. In a three year study of 200 patients receiving oxycodone, the most frequent adverse effect was constipation and nausea

(Smith & Laufer, 2014). In cancer patients, 40-60% of those taking medically prescribed opioids experience constipation (Sizar et al., 2024). Opioid-induced constipation (OIC) is caused by the inhibition of gastric emptying and peristalsis by opioid stimulation. The increase in absorption of fluid leads to the hardening of stool and thus constipation. Other mechanisms through which opioids cause constipation is the increase of the anal sphincter tone, impairing defecation reflexes, and a decrease in the emptying of pancreatic juice and bile which hinders digestion (Sizar et al., 2024). While dietary fiber and fluid intake may help with OIC, traditional laxatives are more efficient at helping to resolve constipation. Newer agents like peripherally acting MOR antagonists (PAMORAs), selective 5-HT antagonists, and intestinal secretagogues have also gained popularity and are widely used to treat OIC (Crockett et al., 2019). The National Cancer Institute (NIH) explains methylnaltrexone bromide (Relistor) as a drug that is a type of peripheral opioid antagonist. It binds to receptors outside the brain, letting the opioids relieve pain but is still able to block certain side effects of opioids.

Narcotic bowel syndrome (NBS) is a significant side effect of opioid use that has seemingly no cure. NBS causes abdominal pain, but when opioid dosages increase to alleviate this, the pain progresses and even gets worse, countering its purpose of analgesia. (Grunkemeier et al., 2007). While pain is the dominant symptom of NBS, nausea, vomiting, bloating, and weight loss are also common symptoms. Unfortunately, there are not many studies on NBS or these counterintuitive effects of opioids. Certain studies suggest that NBS is caused because neural and opioid pathways can both inhibit and facilitate pain (Grunkemeier et al., 2007). Other studies explain NBS is due to neuroplasticity in the brain (Grunkemeier et al., 2007). The known mechanisms of NBS include the activation of excitatory anti-analgesic pathways within the excitatory and inhibitory opioid regulation system (Grunkemeier et al., 2007). Descending facilitation of pain and pain facilitation through dynorphins and cholecystokinin activation may also add to NBS, as well as glial cell activation that produces morphine tolerance and enhances opioid-induced pain (Grunkemeier et al., 2007). To treat NBS, opioid administration needs to be withdrawn slowly, and other medicines are sometimes taken for other symptoms of NBS such as antidepressants and laxatives.

As seen in NBS, opioids may also cause nausea and vomiting. Opioid-induced nausea and vomiting (OINV) is a significant issue for patients taking opioids, because it can cause complications like pulmonary aspiration, dehydration, and electrolyte imbalance (Khansari et al., 2013). As with NBS, OINV's mechanisms are not exactly clear. Opioids can affect vestibular function in various ways with different types of opioids. A recent randomized control trial hypothesized that opioids affect semicircular canal function, which leads to an imbalance between canal input and other sensory information thus causing nausea and vomiting. However, after the trial, the study concluded this wasn't the relevant trigger for OINV (Heuser et al., 2017). The study did however prove that movement triggered nausea independently of visual input, indicating that head-rest is more important to prevent OINV than sleep or eye closure (Heuser et al., 2017). For OINV, antidopaminergic, digestive tract movement-enhancing agents and antihistaminergic agents are usually the first choice for treatment (Hirakawa, 2013). Opioid

antagonists like naloxone and naltrexone may also be used to alleviate nausea and vomiting, and for some patients, a different method of opioid administration may help too (Smith & Laufer, 2014).

Many of the issues opioids cause in the GI tract are due to the prevalence of opioid receptors within this organ system. In the GI tract, MORs and DORs are the most expressed (Galligan & Sternini, 2017). MORs are found specifically in the small intestine and proximal colon while KORs are found in the stomach and small intestine, as seen in rats (Galligan & Sternini, 2017). As such, it can be appreciated that systemic administration/availability of various opioids can lead to off-target effects in organ systems such as the GI tract.

Endocrine System Effects

In the endocrine system, KORs, DORs, and MORs are present. MORs are found in particularly high numbers (Jaschke et al., 2021). Within the endocrine system, opioids cause opioid endocrinopathy (OEI), opioid-induced androgen deficiency (OIAD), cortisol deficiency, and hyperprolactinemia.

OEI covers a variety of effects opioids have on the hypothalamic-pituitary-gonadal axis (HPG axis), which regulates the secretion of gonadal hormones in males and females. Common symptoms include fatigue, depression, hyperalgesia, decreased libido, anemia, and immune suppression. The hypothalamus secretes gonadotropin releasing hormones or GnRH which through follicle-stimulating hormones (FSH) and luteinizing hormones (LH) increases levels of testosterone and estrogen in the body (Medina II & Conermann, 2024). Thus, inhibition of GnRH further causes the inhibition of many hormones involved in the HPG axis, which includes not only FSH and LH but also dehydroepiandrosterone (DHEAS) and growth hormones (GH) (Medina II & Conermann, 2024). Hypogonadism, the production of little or no hormones by the gonads, is a part of opioid endocrinopathy. It occurs in over half of male opioid users (De Vries et al., 2020). As previously said, opioids inhibit GnRH secretion, lowering levels of testosterone and estrogen. Opioids in addition inhibit oxytocin secretion from magnocellular neurons by blocking R-type Ca^{2+} channels (Morris et al., 2010). Low levels of oxytocin are linked to mental health disorders like depression. Opioids slow bone metabolism, leading to low bone mineral density and the impeding of fracture healing in animal models (Coluzzi et al., 2020). These effects are connected to opioid induced endocrine effects. As such, these effects may also be present in humans. Concerning OEI and hypogonadism, testosterone therapy is extremely common for men. It can include buccal, gel, cream, and transdermal patch release formulation (Medina II & Conermann, 2024). However, there is not much evidence supporting hormone therapy treatment in women. Hormone replacement in the form of estrogen-methyltestosterone is the only form of hormone treatment that is approved for women. DHEAS supplementation has shown promise in hormone therapies but is still less well-established than testosterone therapy (Medina II & Conermann, 2024). Other possible treatments include switching opioid classes while maintaining the same dosages, in efforts to mitigate their effects on the endocrine system.

OIAD is a manifestation of OEI and is characterized by low levels of gonadotropins, causing low levels of androgen. As well as OIAD, opioids can inhibit corticotropin-releasing hormones (CRH) and antidiuretic hormone (ADH) secretion (Smith & Elliott, 2012). This results in low levels of the adrenocorticotrophic hormone (ACTH), causing hypoadrenalism. Opioids, specifically morphine and methadone, can cause hyperprolactinemia where there are high levels of prolactin in the blood. MORs, DORs, and KORs mediate tuberoinfundibular dopaminergic neurons. When stimulated, they reduce the activity of these neurons which leads to an increase in prolactin release (Kolnikaj et al., 2000). Treatment for drug-induced hyperprolactinemia includes switching doses or drug class, and the addition of a dopamine agonist (Molitch, 2005).

Brain Mechanisms

Nucleus Accumbens

The nucleus accumbens (NAc) is a brain structure located in the basal forebrain that plays a major role in the reward pathway of the brain. It mediates goal-directed behavior, thus it plays a major role in addiction. Structurally, the NAc consists of a shell and a core.

The NAc houses GABAergic medium spiny neurons (MSNs), different types of interneurons, and glial cells. 90% of the NAc's neurons are GABAergic MSNs (Schofield et al., 2016). These can either have D1 or D2 receptors. D1 dopamine receptors couple to a subtype of G proteins that activate adenylate cycles, thus stimulating cAMP production and other proteins dependent on cAMP. D2 dopamine receptors however couple to a different subunit of G proteins that has the opposite effect of D1 receptors, inhibiting adenylate cyclase and cAMP production (Schofield et al., 2016). Just as D1 and D2 receptors work differently, they contribute differently to drug-associated behaviors and drug-induced alterations in the structure and function of the two cell types (Schofield et al., 2016). Interneurons also have different cell types, three of the GABAergic interneurons being in the striatum. Those expressing parvalbumin generate gamma frequency and aid in the inhibition of cortical pyramidal neurons projecting to striatal neurons (Mannekote Thippaiah et al., 2022). The second type of interneurons co-express somatostatin, neuropeptide Y, and neuronal nitric oxide synthase. The third type expresses calretinin (Schofield et al., 2016). The fourth type of interneuron is cholinergic and is maximally responsive to stimulus detection and context recognition in contrast to dopamine rigid neurons (Schofield et al., 2016). They are regulators of striatal network activity and output. Cholinergic interneurons have been shown to hold an essential role in motivation and mood regulation. For example, one study found a correlation between a reduction in cholinergic interneurons and depressive behavior (Warner-Schmidt et al., 2012). Astrocytes, a type of glial cell, regulate glutamatergic synaptic plasticity in the NAc through the control of glutamate concentration and coordinated uptake and release (Schofield et al., 2016). Other than the cells, core, and shell, the NAc also accounts for the extracellular matrix, a network of proteins and molecules that make up 20% of the total volume in our brains (Schofield et al., 2016). The extracellular matrix consists of 2 main proteins. It essentially provides support for the brain's cells, as well as regulates neurotransmission and cellular growth (Schofield et al., 2016).

Fig 2. Different types of cells within the NAc. Created in BioRender.com

The NAc is a key structure regarding all drug use disorders. As chronic use of opioids continues in a person, the connection between neurons within the brain weakens or strengthens depending on the brain area. In the NAc, connections increase in size, number, and strength, contributing to enhanced synaptic connectivity between neurons (LearnGenetics, 2013). Connectivity changes cause drug-seeking behaviors to morph into habits, which thus lead to addictions or substance use disorders. These changes in neuronal connection are not permanent but can still take months to years to fully recover from and return to a normal state. Drugs of abuse, like opioids, induce neuroplasticity in the NAc, leading to drug-seeking behaviors, and are reflected in connectivity changes.

The NAc overlooks withdrawal and drug-seeking behaviors, as evidenced by multiple clinical reports and studies. Specifically, the paraventricular nucleus of the thalamus' inputs to the nucleus accumbens plays a major role in the physical aspects of opioid withdrawal (Zhu et al., 2016). The NAc is such a major component of OUD that it may also be the key to a possible treatment for OUD. A 2023 clinical trial found through neuro imagery that in patients with OUD, deep brain stimulation of the NAc ventral capsule could reduce opioid cravings and therefore use (Rezai et al., 2024). As the deep brain stimulation surgery had no serious complications, research should be continued into the NAc regarding OUD, to find a dependable treatment for it and possibly other drug use disorders. Studies have recently also linked KORs in the NAc to behaviors regarding opioid withdrawal (Zhu et al., 2023). The study suggests that since KORs are abundantly expressed in the NAc, and the NAc overlooks stress-induced cocaine-seeking as

well as motivation for heroin and opioid-withdrawal-related behavior, the addition of KOR antagonists in the NAc could reduce stress-induced cocaine-seeking and reduce motivation to consume opioids (Zhu et al., 2023).

In rats, cannabinoid receptor 1 (CB1) receptors within the NAc were found on the plasma membrane and in the cytoplasm of neuronal and glial profiles (Pickel et al., 2004). Additionally, structural analysis of synapses within the NAc indicates CB1 and opioid receptors participate in similar, if not the same, synapses within the NAc, potentially indicating shared neuronal signaling pathways between cannabinoids and opioids (Pickel et al., 2004). These receptors were generally more abundant in the shell rather than the core of the NAc. Interestingly, only 3% of the MORs found in the NAc using the same technique as the CB1 receptors overlapped with where CB1 receptors were found (Pickel et al., 2004).

Regarding long-term use, a study on 108 young adults found that those using greater quantities of marijuana had delays concerning non-drug reward anticipation in the NAc (Martz et al., 2016). In adolescents, marijuana use was found to lower NAc functional connectivity to the prefrontal cortex, which was also linked to depressive symptoms and anhedonia (Lichenstein et al., 2017). For long-term marijuana users, these adverse effects and symptoms may transform into real complications surrounding reward processing in the NAc, which can unfortunately further encourage future drug use disorders. Similarly, THC was found to impede responses to rewards in the NAc specifically in people with nicotine addictions.

The study concluded that nicotine addiction may be linked to altered endocannabinoid modulation of reward processing in the NAc (Jansma et al., 2013). Human MRI scans have also found that cannabinoid users had higher gray matter densities than those who didn't use cannabinoids in the left nucleus accumbens (Gilman et al., 2014). A higher density of gray matter in the NAc means the NAc itself has a higher density, which could potentially induce more activity. This increase in activity may lead to more drug-seeking behaviors, furthering drug addiction and repeating a harmful cycle. These effects of cannabis, specifically THC, can be found in Figure 3.

Fig 3. Effects of THC in the brain. Created in BioRender.com

Cannabis and opioids both elicit different effects that ultimately encourage drug-seeking behaviors and the formation of addictions. Both substances were correlated with depressive behavior and induced connectivity changes that further led to other harmful effects on the brain after prolonged use of the substances. These different substances have overlapping effects on the NAc.

Ventral Tegmental Area

The ventral tegmental area (VTA), consisting of the anterior lateral VTA and posterior medial VTA, regulates reward consumption, learning, memory, and addiction-inducing behaviors through the mediation of dopamine (DA) release. It consists of a group of neurons located in the midbrain. These neurons are made of 60% DA neurons, 35% GABAergic neurons, and 5% glutamate neurons (Cai & Tong, 2022).

In the VTA, dopamine-releasing neurons express tyrosine hydroxylase (TH), dopamine transporter (DAT), and vesicular monoamine transporter 2 (VMAT2) (Mannekote Thippaiah et al., 2022). These DA neurons either fire in a stable tonic pattern or in a high-frequency pattern. The latter releases more dopamine quicker into the NAc, driving reward (Mannekote Thippaiah et al., 2022). In contrast, a stable tonic firing pattern releases less dopamine and therefore has a smaller reward. GABAergic neurons in the VTA respond to aversive stimuli, while glutamate neurons express vesicular glutamate transporter 2, VGlu2, both of which contribute to reward

and motivation signaling (Cai & Tong, 2022). This is through the local release of glutamate in the VTA from distal axons such as the NAc (Cai & Tong, 2022).

Similar to the NAc, chronic drug use is often followed by an increase in excitatory synaptic strength in VTA DA neurons. In a study covering cocaine's effect on the VTA, cocaine causes synaptic changes to surface onto VTA DA neurons. This led to long-lasting increases in their burst firing causing major changes in the DA system (Creed et al., 2016). Changes in synaptic plasticity by all drugs of abuse in VTA DA neurons further induce the development of inhibitory synaptic plasticity and enhancement of excitatory synaptic strength (Creed et al., 2016). All these changes in the VTA DA cells induce behavioral changes. Because neuroplasticity regulates the structural regulation of neuronal spines as well as signal transduction, changes in neuroplasticity leads to many issues in the brain, contributing to the development of neurological and psychiatric disorders (Duman, 2004).

During cannabis use, the VTA releases excessive amounts of dopamine neurons into the brain, just as with other drugs. Systemic administration of delta 9-THC, a chemical found in cannabis, along with the synthetic cannabimimetic aminoalkyl indole WIN 55,212-2 created dose-related boosts in the firing rate of dopamine neurons in the VTA (French et al., 1997). This increase encourages further drug-taking and therefore the development of a drug use disorder. Recently, an age-dependent neural plasticity caused by THC has been discovered in the VTA. In young mice, VTA GABA cells in the VTA display long-term depression, or LTD, which is a state of synaptic plasticity (Ostlund et al., 2023). After regular exposure to THC, LTD was found to have been erased in the VTA. A seven-day withdrawal from THC resulted in restored LTD, but adult mice needed double the synaptic stimulation the younger mice required. The result of this study suggests as people get older, the brain's natural ability to heal itself from the negative effects of drugs one consumes wears down, and eventually may not function properly anymore. While the young mice are able to heal quickly, the adult mice take longer to do so, and this effect can only get worse as chronic drug use continues.

Mesolimbic Pathway

The mesolimbic pathway consists of the NAc, VTA, amygdala, hippocampus, and prefrontal cortex. It is the central reward pathway of the brain. When dopaminergic neurons are activated in the VTA, dopamine is released from the VTA and into the NAc synapses. When a natural amount of dopamine arrives in the NAc, the brain is able to elicit a behavioral response from cues (Becker-Krail et al., 2022). Studies of animals receiving dopamine receptor antagonists in the NAc were not able to perform operant behaviors in response to different cues (Nicola et al., 2005). It is important to note that all substances of abuse modulate the mesolimbic pathway through dopamine.

When the brain and mesolimbic pathway are exposed to chronic drug use, neuroplasticity changes occur in both the VTA and NAc, driving reward-seeking behaviors. The first most common example of neuroplasticity changes in the brain is tolerance and physical dependence (O'Brien, 2009). Over time, the brain counteracts high stimulation through mechanisms to

reduce excitability. One mechanism by which this is mediated is through reduced expression of synaptic dopamine receptors and increasing expression of dopamine transporters (DATs), effectively reducing dopamine transmission. Over time, this makes the brain less responsive to the drugs it is receiving, which unfortunately also applies to endogenous reward signaling naturally occurring in the brain. In short, this phenomenon is called tolerance and causes the user to feel less rewards or less of a 'high' over time even with a continued use of the same dosages. To combat this, users take higher doses of drugs to get the same feeling repeating the cycle. In addition, activities releasing endogenous opioids and natural dopamine would be similarly affected, felt less by the user. This cycle leads to addiction. The second most common example of changes in neuroplasticity is compulsive drug-seeking behaviors as previously mentioned. Compulsive drug-seeking behaviors due to neuroplasticity can be irreversible, making recovery difficult (O'Brien, 2009). These two phenomena increase risks for addiction and are what make drug use dangerous.

Conclusion

Understanding the bodily and brain effects of opioids is of great importance particularly now, as the U.S. faces a currently ongoing opioid epidemic. Rising rates of early-onset cancer facilitate the further increase in the use of opioids as pain relievers. Regarding the body, there are clear connections between opioids and the heart, with opioids inducing TdP, parasympathetic cardiac activity, and QTc prolongation. There are still likely effects on the heart by opioids that have not yet been discovered, suggested by the presence of MORs on cardiac neurons. In addition, opioids give rise to adverse effects in the gastrointestinal system including NBS, OINV, and OIC. NBS in particular has no cure and not much is known about the symptom. Lastly, opioids cause a wide variety of issues in the endocrine system, coined OEI. OEI covers OIAD, cortisol deficiency, and hyperprolactinemia. Many of these effects of opioids generally have no widespread cure but instead generally result in the prescription of additional drugs.

In the brain, the mesolimbic pathway and specifically the NAc and VTA have been covered. Drug use in the NAc induces neuroplasticity, resulting in an increase of neuronal connections, morphing drug-seeking behaviors into habits and addictions. This pattern of increasing excitatory synaptic strength is found again in VTA DA neurons, causing an influx in synaptic plasticity, which leads to neurological disorders. Regarding cannabis use, dose-related boosts in the firing rate of dopamine neurons happened in the administration of opioids as well as delta-9 THC. Cannabis use was found to cause an age-dependent neural plasticity, LTD which differs from the plasticity caused by opioids in the brain. Within the NAc, CB1 receptors and opioid receptors were found to participate in similar synapses, which could mean they share neuronal signaling pathways. Cannabinoid users were also found to have higher gray matter density, leading to drug-seeking behaviors. Cannabis and opioids overlap greatly in the fact that they both are addictive drugs that induce tolerance and dependence with permanent effects on the brain, particularly as one gets older.

As mentioned previously, there is still a significant lack of information regarding opioids and their effect on the brain and body. Effects of opioids on the heart have yet to be discovered, as well the mechanisms for NBS. There currently are not enough studies on how NBS works, and thus there is no cure for the painful syndrome. Within the brain, there are a multitude of ongoing studies aiming to help those with OUD, such as a trial overlooking the effects of deep brain stimulation of the NAc ventral capsule on opioid cravings that shows significant promise. There are still aspects of opioids and their mechanisms in the brain that remain unknown, which links to potential treatment methods for those with OUD. Treatment of OUD includes replacement or substitution therapy, rehabilitation, group therapy, reward cooperation, and cognitive behavioral therapy. With these therapies in mind however, relapse rates remain high. Medication-assisted-treatment has a success rate of over 50% and is another step towards the end of the opioid epidemic. Still, it is of great importance that research continues in the area of opioid use disorder, furthering our understanding of its effect on the body, brain, and mind. Certain genes are linked to addictions, increasing specific peoples' risks of becoming addicted to different substances. Professor Brian Anderson explains in an article that attentional biases for drug cues are a normal cognitive process that everyone undergoes (Anderson, 2016). Essentially, everyone has a form of addiction or exhibits addictive behaviors because of our biases within reward learning. Addiction in some form will always be present in humans. Thus, it is profoundly imperative that research is continued into the psychology and scientific mechanisms of addiction. Through this, more efficacious treatments may be created to better the lives of currently almost 50 million people battling addiction in the U.S.

Visualizing Dementia's Impact: Analyzing MRI Scans to Identify Key Brain Regions through Python-Based Image Comparison By Aditya Kudaravalli

Abstract

MRI scans of dementia patients were analyzed to identify commonalities and differences in specific areas when compared to non-demented patients. Using Python, average images of the brain scans for both groups were created, and the differences were plotted to visually highlight regions of significant variation. This approach identified critical areas affected by dementia, such as the hippocampus and ventricles, which display distinct patterns of atrophy and enlargement, consistent with previous studies. By generating these comparative images, this analysis aimed to enhance understanding of how dementia structurally impacts the brain, providing a visual representation that can aid in more accurate diagnosis and assessment of the disease's progression. These visual insights contribute to the broader goal of utilizing computational methods to pinpoint early indicators of dementia, offering potential pathways for future AI models to further refine the detection and prediction of this condition.

Introduction

Alzheimer's disease (AD) is a progressive neurodegenerative disorder that primarily affects the elderly, leading to cognitive decline and memory loss(1). It is the most common cause of dementia, accounting for an estimated 60-80% of cases worldwide (1). The diagnosis of Alzheimer's disease often occurs at a later stage of the disease progression when significant brain damage has already occurred, making treatment and intervention less effective (2).

Current diagnostic methods for Alzheimer's disease include clinical evaluations, cognitive testing, neuroimaging, and biomarker analysis from cerebrospinal fluid (CSF) and blood samples (3,4,5). While these methods are helpful, they each have notable limitations. Clinical evaluations and cognitive testing are inherently subjective, with outcomes often dependent on the clinician's expertise. Furthermore, these methods are less effective at detecting early-stage Alzheimer's when symptoms are mild (3). Neuroimaging techniques, such as magnetic resonance imaging (MRI) and positron emission tomography (PET) scans, can identify brain changes linked to Alzheimer's, but they are costly, not widely accessible, and may only be helpful to detect late-stage dementia (4). Biomarker analysis from CSF and blood samples, while promising, can be invasive and is not always conclusive in providing a definitive diagnosis (5).

The early detection of Alzheimer's disease is essential for several reasons. Early intervention has been shown to slow disease progression, improving patients' quality of life (6). Identifying Alzheimer's in its initial stages also allows patients and their families to plan for the future, seek support, and make informed decisions regarding long-term care (7). Additionally, the identification of early-stage patients is critical for advancing research and development, as these patients can participate in clinical trials that test new treatments and therapies (8).

The primary objective of this project is to analyze patterns in MRI scans of patients with and without dementia and to understand patterns in patients with dementia.

Literature Review

Neuroanatomical differences between dementia patients and those without dementia are well-documented in the literature, primarily in relation to brain structure (3). These structural changes are critical for understanding the progression of dementia and for improving diagnostic accuracy through imaging techniques like MRI. One of the most affected regions is the hippocampus, a key area for memory formation, which is often among the first regions impacted in dementia, particularly in Alzheimer's disease (3). Studies consistently show significant atrophy in the hippocampus and surrounding medial temporal lobe structures in patients with dementia compared to healthy individuals (1,2). This atrophy correlates closely with the degree of cognitive impairment, as more advanced stages of dementia are associated with more severe hippocampal shrinkage (3).

Beyond hippocampal atrophy, other brain regions, such as the entorhinal cortex, amygdala, and parietal lobes, also exhibit varying degrees of shrinkage in dementia patients. These structural changes contribute directly to hallmark symptoms of dementia, including memory loss, disorientation, and difficulties with spatial awareness and navigation (1). Additionally, white matter lesions and a general reduction in brain volume have been reported in patients with dementia, further distinguishing them from non-dementia individuals and providing additional markers for disease progression (5).

Understanding these neuroanatomical differences is crucial for interpreting MRI scans within the context of dementia diagnosis. The identification of specific patterns of brain atrophy and other structural changes allows for more precise differentiation between types of dementia, as well as for tracking the progression of the disease over time (12).

In analyzing the MRI images of dementia and non-dementia patients across sagittal, transverse, and coronal views, distinct neuroanatomical differences that highlight the impact of dementia on the brain. The coronal view consistently revealed pronounced atrophy in dementia patients, particularly in the hippocampus and surrounding medial temporal lobes—regions critical for memory formation and cognitive function. This atrophy is coupled by significantly enlarged ventricles, a common occurrence in many forms of dementia that reflects the substantial loss of brain tissue in adjacent areas. The enlargement of the ventricles is most evident in the transverse and coronal views, where the increased size results in wider spaces filled with cerebrospinal fluid, visible as darkened regions around the ventricles. These changes are stark when compared to the brains of non-dementia patients, which show smaller ventricular spaces and well-preserved cortical thickness, indicating healthier brain structures. The visible degeneration and tissue loss underscore how dementia affects critical brain regions and contributes to the cognitive decline characteristic of the disease. These MRI differences provide crucial insights into the neurodegenerative processes underlying dementia, illustrating the profound structural impact of the condition and reinforcing the importance of advanced imaging techniques in early diagnosis, monitoring, and understanding the progression of dementia.

Methods and Results

MRI and clinical patient data were obtained from the Oasis 1 dataset (12). Data for subjects 22, 24, 26, 29, 34, 28, 30, 33, 35, and 39 were used. Subjects with a dementia score ≥ 1 were classified as dementia patients, while all others were classified as non-dementia patients. Images of both non-dementia and dementia patients were plotted to compare differences that could indicate affected areas of the brain. The MRI scans were averaged for each view for both non-dementia and dementia patients. Subsequently, the average dementia images were subtracted from the average non-dementia images to create an average image from each category from three different perspectives.

A caveat in this analysis is that the images for dementia and non-dementia patients were not perfectly aligned, leading to conflicting skull outlines, which made the average images blurry and the analysis harder to interpret. It is important to note that raw data was used to create the average images; using processed data would have simplified and improved the accuracy of this process. Specific tools, such as FreeSurfer software, would have enabled better alignment of the images, resulting in a clearer analysis.

Discussion

The next step of this project would be to develop an Artificial Neural Network (ANN) specifically to detect dementia. This would involve expanding the dataset to include more diverse MRI scans and patient information. An ANN would be created by adding layers, like convolutional layers, which are great for image analysis. Techniques, such as backpropagation, would be used to fine-tune its accuracy. Additionally, including clinical data along with MRI images could help the model make more precise predictions, aiding in earlier and more reliable dementia diagnoses.

To detect dementia, the ANN processes input data such as MRI scans and medical history through multiple layers of neurons. Each layer extracts and transforms features from the data, progressively refining the model's understanding. The final output layer provides a decision or classification based on the transformed features, indicating whether the patient shows signs of dementia.

The primary data used in an ANN project includes MRI scans of patients' brains (12), as well as supplementary medical history information (13). This includes age, dominant hand, education level, and socioeconomic status. These diverse data sources provide a comprehensive view, enabling the ANN to learn from both visual and non-visual patterns associated with dementia (8).

Effective data preprocessing is crucial for training robust neural networks. Cleaning the data involves removing irrelevant or noisy information, handling missing values, and addressing outliers. Normalizing the data ensures that each feature contributes equally to the model, preventing any single feature from disproportionately influencing the results (10).

Missing data can be handled through techniques such as imputation, where missing values are replaced with estimated ones based on the remaining data. Outliers, which are data

points significantly different from others, can be identified and either removed or transformed to minimize their impact on the model (9).

To maintain consistency and improve model performance, all images are resized to a standard dimension of 224 by 224 pixels. This uniform size ensures that the ANN processes each image in the same way, facilitating efficient learning. Normalizing the images also involves scaling pixel values to a standard range, typically between 0 and 1, which helps in stabilizing the training process and speeding up convergence (10).

By resizing the images to 224 by 224 pixels, we established a consistent input format, ensuring that our ANN can effectively learn from the data and accurately detect signs of dementia (10).

Advancing VLCAD Treatment: The Future Role of Targeted CRISPR-Cas9 Therapy By Arjun Patel

Abstract

VLCAD deficiency is a rare genetic disorder of a fatty acid metabolism that currently has many symptom management options but no cure. CRISPR-Cas9 is emerging as a possible treatment plan for this deficiency. Given the rise in CRISPR-Cas9 technology for treating genetic diseases, this paper will delve further into how it could be used to correct the VLCAD enzyme deficiency. CRISPR-Cas9 is a technology that can already target specific genes and has the possibility to change the lives of many patients affected by this disease. Despite the fact that CRISPR-Cas9 has many limitations and has still not been used to treat VLCAD in humans, it is still a viable tool that could be used to treat the VLCAD disease.

Discussion

Very long-chain acyl-coenzyme A dehydrogenase (“VLCAD”) deficiency or very long-chain acyl-CoA dehydrogenase deficiency (“VLCADD”) is a rare genetic disorder of a fatty acid metabolism (Mp). VLCADD is quite rare and estimated to affect 1:40,000 patients. VLCADD is defined as a health condition where the enzyme that starts the initial step in the process of turning food into energy of very long-chain fatty acids is missing or not working properly (Leslie and Saenz-Ayala). The breakdown of fatty acids takes place in well-defined structures in each cell, called the mitochondria, that are located in the cytoplasm of cells where energy is produced during the breakdown of complex substances into simpler ones (Nord). This condition prevents the body from being able to turn very long chain fats into energy due to the missing enzyme. Patients with VLCADD present with the following types of symptoms: lack of energy, muscle weakness, and low blood sugar. It is very common for these patients to experience muscle pains due to the breakdown of muscle tissue, particularly if fasting, being sick, exercising extensively or exposing themselves to extreme temperatures (Mp). These patients also have a propensity for having serious heart or liver problems. There is no cure for VLCADD at this time; however, there are several medical treatments that help patients prevent, manage or otherwise control their symptoms.

The predominant treatment plan for VLCADD focuses on keeping periods of fasting at a minimum (Leslie and Saenz-Ayala). For example, care for newborns who are diagnosed with VLCADD requires feeding frequently to avoid fasting, even during the night. Additional treatments are geared towards nutrition and diet, such as eating low-fat, high-carbohydrate foods with frequent feeding intervals. Beyond lifestyle changes, medications can also be used to manage this disease. Patients may also take supplements of carnitine if there is evidence of a carnitine deficiency, but this has not been widely studied, so it remains controversial among metabolic physicians (Nord). Riboflavin was often recommended but has recently not been shown to be beneficial and thus, has not been very prevalent. In addition, Bezafibrate is an experimental medication originally developed to lower blood cholesterol but also shown to

increase the amount of VLCAD protein in cells; however, limited clinical studies have been published to show its efficacy in use for treating VLCAD and no active clinical trial is currently in progress. One additional recommendation includes supplementing with medium chain triglycerides, commonly ingested as MCT oil (Leslie and Saenz-Ayala). In June 2020, the United States Food and Drug Administration (“FDA”) approved Triheptanoin for the treatment of long chain fatty acid oxidation disorders, including VLCADD because it was shown to improve long term effects of the disease as compared to similar doses of MCT oil (Shirley). Given that all the current treatments are only for the purpose of reducing any symptoms, it is important to find a cure for VLCADD to improve the lives of such patients, and new gene-editing technologies may be a possible solution.

CRISPR is a cutting-edge gene editing technology, having the potential to cure rare genetic diseases because it can edit DNA. CRISPR stands for Clustered Regularly Interspaced Short Palindromic Repeats, and Cas9 is a CRISPR associated protein (Doudna). Together, the CRISPR-Cas9 system is a method of locating precise gene sequences, making a break in the DNA at the specific location, and allowing for the opportunity to edit such sequences by modifying the gene it is targeting. Because CRISPR-Cas9 can edit DNA, mutations can be entirely erased or replaced in a patient. The CRISPR-Cas9 system has the ability to treat infectious diseases, autoimmune disorders, cancers, and rare genetic disorders. Many recent clinical trials using cells edited with CRISPR-Cas9 have been approved for treating cancer (Liu et al.). There are a growing number of preclinical studies based on rodents showing the potential for this treatment plan to work well. To date, the CRISPR-Cas9 system is widely used to correct genetic variants with the hope of treating many human genetic diseases. An example of which are inherited diseases, which are generally diseases that do not currently have any cure, including without limitation sickle cell disease, β -thalassemia, and hemophilia. On December 8, 2023, the FDA approved two milestone treatments, Casgevy and Lyfgenia, which are both gene therapies for the treatment of sickle cell disease in patients 12 years and older (Fda). This is a signal that gene therapy is advancing in modern science and can be successfully used for the treatment of genetic disorders. This research paper will investigate how CRISPR-Cas9 technology could be used to correct a VLCAD enzyme deficiency at the genetic level.

VLCADD is a rare genetic disorder that is inherited when both parents have a copy of the recessive gene causing the disorder (Nord). The parents of an individual with an autosomal recessive gene each carry one copy of the gene mutation, but usually do not show any signs or symptoms (Mp). Mutations in the ACADVL gene cause VLCADD because this gene provides the instructions for making an enzyme called very long-chain acyl-CoA dehydrogenase, which is required to break down very long chain fatty acids found in foods and the body’s fat tissues. Variants in the ACADVL gene lead to a shortage or deficiency of the VLCAD enzyme within cells, leading to the symptoms previously discussed (Leslie and Saenz-Ayala).

Gene therapy using an adeno-associated virus has been shown to help treat VLCADD based on improved laboratory test results within the first two (2) weeks of treatment on mice who were challenged to fast yet maintain glycemic values (Kosak). Given that the blood glucose

levels improved in the mice that went through this gene therapy, and the confirmation of the VLCAD protein in targeted tissues, the ability for gene therapy to work to treat VLCADD seems hopeful. One of the reasons why VLCADD is a potential candidate for treatment using the CRISPR-Cas9 system is because the genetic cause of this disorder is known. The protein encoded by the ACADVL gene can be targeted because it is the first step of the fatty acid oxidation process, which may be missing or working improperly (Ncbi). In fact, the ACADVL gene could be targeted by the CRISPR-Cas9 system such that the gene could be identified, cut and replaced in an affected patient. Then, that patient's cells could produce the previously missing enzyme and properly break down very long-chain fatty acids (Nord). VLCADD is a rare genetic disorder where the enzyme to break down very long-chain fatty acids is missing and although there are some treatment options, there is no cure. Because VLCADD has a known gene sequence, the CRISPR-Cas9 system could help provide a cure because of its capability to edit the ACADVL gene.

VLCADD is typically tested during routine newborn screening, so the mutations in the ACADVL gene associated with VLCADD are known (D'Annibale et al.). In fact, newborn screening does often find different variations in the ACADVL gene, creating uncertainty in diagnosis and treatment. Currently, ACADVL has more than three hundred identified variants. That said, the CRISPR-Cas9 system has already been used to recognize the ACADVL gene. CRISPR-Cas9 system was used to knock out ACADVL in HEK293T cells, and this targeted deletion was subsequently confirmed using laboratory testing. This shows that the CRISPR-Cas9 system can properly target and delete the ACADVL gene associated with causing VLCADD. Knowing that the CRISPR-Cas9 system can identify the ACADVL gene means that the CRISPR-Cas9 system can likely also be used to edit or modify such ACADVL gene (Bi). The CRISPR-Cas9 system can be used for diagnostic purposes such as identifying specific stretches of genetic code on the ACADVL gene and can be further tested for gene editing in such precise locations. There are many clinical trials in progress with the use of CRISPR-Cas9 (Henderson). The approval of the gene editing technology for the use to cure sickle-cell disease was one of the major landmarks for this technology. The Casgevy drug approved by the FDA can also cure transfusion-dependent beta thalassemia. The CRISPR-Cas9 system has been used to treat patients with cancer (Regaldo). In the pipeline now, there are other diseases that are being tested for treatment using the CRISPR-Cas9 system, such as autoimmunity. CRISPR based treatments may also be extrapolated for different disease causing mutations within the same gene because scientists can standardize part of the treatment plan such as the Cas protein, the method of delivery to the cells, how treatment is administered and what is given to patients (Henderson). Treatments could be customized by modifying the specific guide RNA sequence and any gene editing differences. So, treating new conditions can be scaled based upon the knowledge discovered by treating existing conditions. To date, gene therapy shows a lot of promise but still needs more testing for VLCADD. For example, gene therapy and mRNA have been used to help treat VLCADD but have only been tested on mice, not humans (Kosak). Despite the promise for

the applications of CRISPR-Cas9, there are some challenges to be addressed in clinical treatments in patients with different diseases using CRISPR-Cas technologies (Liu et al.).

The reason CRISPR-Cas9 has not yet been used for the treatment of VLCAD has been due to its current limitations. One major concern is the possibility for off-target effects, this is when the CRISPR-Cas9 accidentally edits other locations in the genome. Reducing this risk likely requires increasing specificity for the target or reducing the timeline for the Cas9 activity to take place (Yang et al.). For example, shortening the half-life for the Cas9 system delivery method has worked better as well as increasing the specificity of where the DNA is cut. In addition, since the discovery has been made through newborn screening that there are many different variants of the ACADVL gene, there is a concern about the heterogeneity amongst patients, as also seen in a study related to another similar fatty oxidation disorder called MCADD (Odendaal, Christoff, et al.). Despite these risks, scientists in the field are working to overcome these limitations, and have made some recent breakthroughs with the approval of Casgenvy (Henderson). While the issue of cost still remains an issue, since the Casgenvy treatment has a \$2MM price tag, the use of CRISPR-Cas9 continues to be an exciting technology that offers the promise of finding cures to so many rare diseases that have baffled scientists to date. In 2022, the U.S. Congress passed legislation directing the FDA to create a platform technology designation to help reduce costs and break the barriers for both producing and offering life-changing therapies such as gene editing using the CRISPR-Cas9 system. It is likely that a combination of government support and personalized treatment will be needed for a breakthrough treatment for VLCADD using the CRISPR-Cas9 system (Mathur and Sutton).

In summary, VLCADD is a rare genetic disorder, caused by a known recessive gene called ACADVL that currently has no cure and the symptoms can only be managed (Nord). The CRISPR-Cas9 system for gene editing has the potential to cure VLCADD upon further clinical testing because the gene and several known variants have already been identified, and the gene editing therapies have been tested in mice (Zhao et al.). Furthermore, the CRISPR-Cas9 system was recently approved by the FDA to cure a rare disease, paving the way for approval of similar treatments (Henderson). Despite any limitations with respect to clinical treatment development, the CRISPR-Cas9 system likely remains a viable option to explore for the future treatment of VLCADD.

Efficient Zero-Shot Visual Prompt Engineering for Creative Story Writing

By Felix Deng

ABSTRACT

Large Language Models (LLMs) [1] are extensively utilized for generating stories, showcasing their ability to handle complex, creative tasks. To begin the process of story generation, an initial textual prompt is required. The prompt is iteratively refined such that the discrepancy between the user's expectations and the story generated from the prompt is minimized. Each iteration is a time-consuming process; the user needs to read and analyze the story in order to refine the prompt. A key insight from cognitive research suggests that analyzing visual data is 60,000 times faster than textual analysis [2]. This paper proposes visual prompt engineering for story generation wherein textual prompts are transformed into images using a diffusion model [3], then refined based on the discrepancy between the user's expectations and the generated image. This refined prompt is then used to generate a story. The entire process is repeated until the user is satisfied with the story. This method leverages the relative speed of image processing to enhance the quality of text generation per iteration. Experiments show that for the same number of iterations, stories generated by visual prompt engineering outperformed those generated by text-based prompts in terms of story quality.

Figure 1: Visual prompt engineering.

1: Introduction

Generative AI has revolutionized various fields by enabling the creation of content through large language models. One of the critical advancements in this area is the use of prompt engineering, which involves optimizing inputs to guide the behavior and outputs of language models (LLMs). This technique helps in steering the models to generate text that is more relevant to the prompt, enhancing their usability in creative and practical applications.

Despite these advancements, leveraging LLMs to create high-quality stories presents significant challenges. The iterative process of text generation is inherently time-consuming, requiring careful tuning of prompts and multiple rounds of generation to achieve the desired

outcome. Furthermore, reading and evaluating the generated text further increases the time spent, making the process labor-intensive.

2: Related Work

Iterative Prompting

Iterative prompting [4] involves refining the prompts given to a Large Language Model (LLM) through multiple rounds of feedback and adjustment. This process is akin to an interactive dialogue with the model, where initial outputs are reviewed, and the prompts are tweaked to steer the model towards more accurate or creative outputs. Iterative prompting can be manual, involving human oversight, or automated using feedback loops within the AI system.

The exact process of iterative prompting is as follow:

1. User provides a broad initial prompt, such as "generate a story about a bear."
2. The response from the model is then analyzed to assess its relevance and quality. Based on the user's expectations, the prompt is refined to be more specific, such as "generate a story about a brown bear."
3. This cycle of generating, analyzing, and refining is repeated until the desired output is achieved. This iterative approach helps in honing the model's responses to be more aligned with the user's expectations.

Figure 2: Iterative prompting. [5]

Despite its effectiveness, iterative prompting has several limitations. The process is time-consuming, as it requires the user to read and evaluate the results after each iteration. It also requires the user to optimize the original prompt for each iteration, another lengthy process. This need for continuous oversight and optimization can be labor-intensive, especially for complex tasks or long outputs.

Auto Prompting

Auto prompting [6] refers to the automated generation of input prompts for Large Language Models (LLMs). This technique involves the use of algorithms or smaller, specialized models to craft prompts that are optimized to elicit the best possible response from an LLM. The goal is to reduce human labor in the prompt engineering process and to increase the efficiency and consistency of the outputs. Auto Prompting can be particularly useful in applications like chatbots, content generation, and other interactive AI systems where dynamic and contextually appropriate responses are crucial.

The exact process of auto prompting is as follows:

1. The user provides an initial prompt and relevant labeled training data to the system.
2. A masked language model (MLM) is trained based on the data.
3. Based on the data, prompts are generated and refined based on the output of the MLM. This process is repeated until high-quality responses are generated.
4. After the prompt is optimized, it is returned to the user.

Figure 3: Auto prompting. [7]

Although auto prompting significantly boosts prompt quality, one of the primary limitations of Auto Prompting is the time required for optimization. The process of refining a prompt can take several minutes, which may not be suitable for applications requiring immediate responses. Additionally, the computational resources required for this optimization translate into costs, with each optimization cycle potentially costing around \$1 [8].

3: Solution

To address these challenges, a solution is proposed in the paper where image generation is integrated into the creative process. Diffusion models, which convert textual descriptions into visual content, offer a promising alternative. Analyzing images is 60,000 times faster than analyzing text [9] due to the innate human ability to process visual information. This assumption

is supported by cognitive studies that show faster comprehension and retention of visual data compared to textual data.

To assess the viability of integrating image generation into story creation, it is crucial to demonstrate that this approach is more efficient than the baseline, iterative prompting.

How does the incorporation of visual imagery in prompt generation affect the efficiency of the iteration process?

4: Experiment Design

To evaluate the effectiveness of image-based prompt engineering, we undertook a comprehensive study involving the comparison of an iterative prompting method and image-based prompt engineering to test the efficiency of our approach.

Methods

For this experiment, two methods, methods A and B, were used. Method A is the baseline model, where text is directly sent to a LLM to produce a story. Method B uses image generation, as text is converted to an image through DALL-E 2 and then converted into text using an image-to-text model.

Figure 3: Diagram of Method A.

Figure 4: Diagram of Method B, where text is converted into an image first.

Time

One of the main concerns with visual prompting is the increase in time per iteration compared to the baseline. However, this time increase was found to be negligible.

The amount of time per iteration for Method A was found to be $T_A = T_{read} + T_{generate}$

The amount of time per iteration for Method B was found to be

$$T_B = T_{read} + k * (T_{image} + T_{analyze})$$

T_{read} is the amount of time needed to read and analyze a 500-word story, roughly 21 minutes.

This is because of the many small components of this task:

- Reading the story: The average human reading speed is 200-300 words per minute [10], so one full reading will take 2.5 minutes. For further comprehension, another readthrough will be necessary, so 5 minutes will be spent on reading in total.
- Analyzing the story: An editor can edit roughly 500 words in 16 minutes. [11]

$T_{generate}$ is the amount of time needed to generate a 500-words story, roughly 15 seconds. I timed GPT-4 50 times while it generated stories to get the average amount of time.

k is the amount of iterations to fully refine a prompt based on generated images, on average around 5 iterations.

T_{image} is the amount of time to generate an image based on a prompt, also roughly 15 seconds. I timed my diffusion model 25 times while it generated stories to get the average amount of time.

$T_{analyze}$ is the amount of time for the user to analyze an image, an amount of time which is negligible considering that analyzing images is much faster than analyzing text.

Thus, Method B takes roughly 75 seconds longer than Method A per iteration. This slight time increase can be ignored, as the story analysis process takes 21 minutes on average.

Generating Story Subjects

For each genre, 200 varying story subjects were generated. A story subject refers to the main character or central theme of a story, such as "a lonely bear." These subjects were used as prompts to guide the LLMs in story creation.

Iterative Story Generation Process

1. Initial Prompting: The story subject is fed into Method A and Method B.

2. Word Count Adjustment: Each generated story should be roughly 500 words. To generate these stories, the iterative prompting process was employed, where:

3. Refinement: Users refine the story subject of both Method A and Method B by reducing discrepancies between their expectations and either the generated story from Method A or the generated image from Method B.

4. Iteration: Steps 1-3 are repeated either 5, 10, or 20 times to ensure quality. In the end, the prompts from Method A and Method B are converted into stories for grading.

Assignment and Grading of Stories

1. Random Assignment: 30 prompts and 60 stories, 30 generated by Method A and 30 generated by Method B, were randomly selected. All 60 stories were each assigned to GPT-4, which graded the stories based on the rubric below.

2. Grading Criteria: Each story was graded on a scale of 1-10 based on five key dimensions:

- Setting: The vividness and clarity of the story's setting.
- Character Development: The depth and believability of the characters.
- Mood/Tone: The emotional tone and atmosphere of the story.
- User Engagement: How captivating and engaging the story is.
- Originality: The uniqueness and creativity of the story.

3. Average Scoring: For each story, the average score across the five dimensions was calculated to determine its overall quality.

This structured approach allowed us to systematically evaluate the quality of stories generated by LLMs and the influence of visual imagery on narrative quality. By using an objective grading system (GPT-4) and rigorous evaluation criteria, we ensured a robust assessment of the stories' effectiveness in various key areas of storytelling. This methodology provides valuable insights into the potential benefits and limitations of integrating image generation into LLM-driven story creation.

5: Results

Table 1. Average results of methods A and B based on number of iterations, given a 500 word requirement.

Iterations	Method A	Method B
1 time	7.4	7.8
2 times	8.4	8.6
5 times	8.7	8.8

The incorporation of image generation significantly enhances the efficiency of the story creation process. By providing visual context, the diffusion model guides the LLM more effectively, reducing the number of iterations required to achieve the desired output. This reduction in iterative cycles translates directly into time savings, making the process faster and more efficient without compromising the quality of the generated stories.

Note that as iterations increase, the increase in quality plateaus. For Method A, quality increases by 1.0, then 0.3. This is because after a certain number of iterations, both models will produce a maximum-quality output. Thus, as models approach this limit, the rate of change of the quality will decrease.

Thus, integrating image generation offers a more efficient alternative, as it produces higher-quality results in less iterations.

Figure 4. Average results of methods A and B based on word requirement, given 2 iterations.

As shown in the above table, method B consistently outperforms method A regardless of the word count. However, as the word requirement increases, the quality of stories generated by both methods approaches a maximum value. The difference in quality between method B and method A narrows over time, decreasing from an initial difference of 0.5 to a minimal difference of 0.1.

This trend indicates that while method B initially has a distinct advantage, the benefits diminish as the length of the story increases. This suggests a potential plateau effect where both methods achieve near-optimal quality for longer stories.

The diminishing difference in quality could imply that as more content is generated, the methods converge in their ability to produce high-quality narratives. This convergence might be due to the increased opportunities for both methods to refine and enhance the story through iterative processes, ultimately leading to a more polished final product.

6: Sample Stories

Both stories are roughly 200 words, generated from the prompt “a lonely bear”.

Method A’s story is shown below:

Once upon a time, in a vast and dense forest nestled between towering mountains, there lived a bear named Oliver. Oliver was not like the other bears in the forest. While they roamed in groups, playing and hunting together, Oliver preferred the solace of his own company. He was a solitary soul, finding solace in the quietness of the woods. From a young age, Oliver had felt different. While the other bear cubs wrestled and played, he often found himself wandering off, drawn to the tranquility of the forest. His parents worried about him, urging him to join the other cubs in their activities, but Oliver couldn't shake off the feeling of isolation that seemed to permeate his very being. Oliver's solitary nature became more pronounced as he grew older. He found joy in exploring the hidden paths of the forest, discovering its secrets and observing its inhabitants from a distance. His keen senses and quiet demeanor earned him a reputation among the animals as a thoughtful and observant bear. While his fellow bears engaged in boisterous activities, Oliver would often be found near a babbling brook or under the shade of ancient trees, lost in thought.

Method B’s story is shown below:

In the depths of an ancient forest shrouded in mist, there exists a bear unlike any other. Named Baran, he was born with an extraordinary coat, a soft golden-brown hue that shimmered when the rare sunlight filtered through the dense canopy. Despite his magnificent appearance, Baran was a solitary figure, his heart weighed heavy with a deep longing for companionship. Baran's mother had often told him stories of the world beyond their forest, of lands filled with bears of various kinds and tales of grand adventures. But those were just stories. In reality, Baran's forest was remote, and he remained the last of his kind in these parts, a gentle giant whose voice had not found an echo for years. Baran's days were filled with quiet contemplation and exploration. He would roam the moss-covered trails, pausing to listen to the whispers of the ancient trees and the melodies of the forest creatures. Despite his solitude, he harbored a flicker of hope that one day he might encounter another bear like himself. His golden-brown coat stood out against the lush greens and earthy browns of the forest, a beacon of his uniqueness in the vast wilderness. Yet, with each passing season, his longing for companionship deepened, echoing through the silent woods.

Method B’s image is shown here:

7: Discussion

The integration of visual imagery into narrative generation using Large Language Models (LLMs) presents a promising avenue for enhancing storytelling efficiency and quality. The findings of our study suggest that using visual prompts can streamline the story generation process, providing a faster alternative to traditional auto prompting techniques. By incorporating images, the iterative process of prompt refinement and story generation can be expedited, making it a more practical approach for applications requiring dynamic content creation.

Applications

One of the primary applications of incorporating visual imagery into prompt engineering is in story generation, where visual prompts can quickly establish context and stimulate creative outputs from Large Language Models (LLMs). This technique can be particularly beneficial for developing authors, game designers, and other creative professionals who rely on high-quality storytelling. By providing a visual context, these professionals can generate more vivid and immersive narratives, enhancing the reader's or player's experience.

Visual imagery can serve as an immediate source of inspiration, helping authors to create detailed and imaginative settings, complex characters, and engaging plotlines. For instance, an image of a medieval castle surrounded by dark forests can evoke a multitude of narrative possibilities, from epic battles to mystical adventures. This approach can help authors overcome creative blocks and produce content that is both rich in detail and emotionally engaging.

In the realm of video game design, visual prompts can assist in the development of storylines and character backstories, making the game world more immersive and believable. Game designers can use visual imagery to create detailed environments and intricate plots that enhance the player's experience. For example, an image of an abandoned spaceship can inspire a thrilling sci-fi adventure game, complete with alien encounters and mysterious technologies.

Visual imagery is especially useful for mitigating writer's block. When writers are unclear on what they want to write about, visual prompts can serve as effective guidelines to help guide their thoughts towards an idea for a story. The image acts as a catalyst, sparking imagination and providing a concrete starting point from which writers can develop their narratives. This can be particularly beneficial for novice writers who may struggle with generating ideas or for experienced writers who face occasional creative slumps.

Overall, the integration of visual imagery into prompt engineering offers a versatile tool that can enhance creativity and productivity across various fields. By providing a rich source of inspiration and a concrete framework for narrative development, visual prompts can help individuals and professionals produce high-quality, engaging content more efficiently.

Future Research

Future research should explore the potential of integrating visual prompts in various text generation tasks beyond storytelling. For instance, visual prompts could be used to enhance the creation of informative articles by providing a visual context that helps the LLM generate more accurate and detailed content. Similarly, in persuasive writing, images can evoke emotions or highlight key points, potentially making arguments more compelling. Instructional content could also benefit from visual aids, as images can clarify complex concepts and make instructions easier to follow. Investigating these applications could broaden the utility of visual prompts in diverse fields.

Another promising area for future research is the development of techniques to handle more complex and multifaceted prompts. Currently, the focus has been on simple, single-subject prompts, but more intricate and layered prompts could lead to richer and more diverse narratives. For example, a prompt combining multiple characters, settings, and plot elements could produce a more elaborate and engaging story. Developing methods to effectively manage and refine these complex prompts will enhance the creative capabilities of LLMs and allow for the generation of more sophisticated and nuanced content.

Ensuring that the generated text accurately reflects the provided visual prompts is crucial for the success of this approach. Future research should focus on improving the alignment between images and the resulting narratives. This could involve developing advanced algorithms that better interpret visual cues and translate them into coherent and contextually appropriate text. Enhancing image-to-text alignment will reduce inconsistencies and inaccuracies in the generated stories, resulting in higher-quality content that better meets user expectations.

8: Limitations

The experiment has certain limitations which may have skewed the results of the experiment.

Firstly, only 200 story subjects were generated. This results in a small sample size, which may impact the results of the experiment. In the future, 1000 or more story subjects should be generated for future replications of this experiment.

Additionally, stories were graded using a specific rubric. While the rubric contains important features which every story should have, it fails to include elements such as cohesion and readability. Additional quantitative metrics, such as the Automated Readability Index (ARI) [12] should be used in future experiments.

Stories were also graded using GPT-4, which interpreted the rubric. We were unable to do human evaluation due to cost and time. Thus, GPT-4 may not evaluate stories in the way which an average human does, which may lead to inaccurate results. To remedy this, a large sample of human graders or a fine-tuned variant of GPT-4 should be used for future experiments.

Conclusion

Overall, incorporating a diffusion model to enhance prompt engineering, particularly in creative story writing, has proven to be more efficient. By integrating visual prompts, the iterative process of refining and generating stories is streamlined, reducing the time and effort required compared to traditional methods. The use of images quickly establishes context, guiding LLMs to produce more relevant and engaging narratives.

Despite its success, several limitations need to be addressed for broader application. The current focus on single-subject prompts and restriction to story generation highlight the need for further exploration into its utility across diverse text generation domains. Enhancing the system's ability to handle more complex and multifaceted prompts could lead to richer and more varied narratives, expanding its potential applications.

While the diffusion model for enhancing prompt engineering in creative story writing has shown significant promise, addressing its limitations through targeted research and development will be crucial for unlocking its full potential across various text generation tasks.

Goya's War: The Human Cost of Conflict in The Disasters of War

By Raymond Zhu

Spanish painter and printmaker Francisco Goya was born in 1746 and displayed tremendous artistic talent from a young age. In 1763, Goya moved to Madrid to pursue his art career and study with painter Anton Raphael Mengs. Mengs assigned Goya to work on tapestry cartoons, which he did from 1775 to 1792. During this period, Goya reached his peak maturity as an artist and proved himself to have impeccable painting technique. As he progressed in his art career, several executives and leaders in Spain commissioned paintings from him, slowly gaining recognition and popularity over the course of the late 18th century. In 1789, Goya was appointed as a court painter by Charles IV, who commissioned him to paint for the royal family, and he painted colorful depictions of the royal family with flawless technique. During his tenure as court painter, Goya contracted a severe unknown illness that took away his hearing and changed his artistic purpose. Once a bright and consistent artist, Goya started experimenting and implementing more raw emotion and dark subjects into his drawings.

Goya was the court painter for the entirety of Charles IV's rule, which ended with his abdication following Napoleon's invasion of Spain in 1807 during the War of the Third Coalition. Although previously allies, Napoleon decided he wanted to add Spain to his empire and expand his rule across more of the European continent. To achieve this, he sent more than 100,000 soldiers to occupy Spain and, in 1808, forced King Charles IV and his successor Ferdinand VII to abdicate, installing his brother, Joseph, as King Joseph I of Spain.

In response to the French occupation, an enormous revolt broke out across Spain. On the Second of May, highly trained and well-equipped French soldiers completely underestimated the relentless Spanish people. They revolted and attacked weak points in Madrid, killing more than 150 French soldiers. As a result, the French soldiers reciprocated by slaughtering thousands of Spaniards. The two sides would torture and slaughter prisoners from the opposing side, marking the start of the Peninsular War. Although the French had highly trained intelligent personnel, they were kept in Spain for 5 years, unable to crack the will of the Spanish people ([PBS](#)).

Simultaneously, Goya was traveling throughout Spain, seeing firsthand the trauma and dangers that Spaniards had to endure everyday. He could feel the torture, raw emotions, and grief evoked by war, and although Goya remained "neutral" during the war, his artworks suggest that he sympathized with the Spanish resistance. One of the most significant works from this period was a series of 82 prints known collectively as *The Disasters of War* (*Los desastres de la guerra*). Goya had begun working on these prints while still retaining his position as court painter with the new king, and, although his intentions are not clearly stated, it is widely believed the prints were created as a visual protest against the true horrors of war. Goya etched the plates chronologically, arranging the scenes depicted into different time periods: the events during the war, the famine that occurred afterwards, and the return of Ferdinand VII. While Goya was 62 at the time of the Bourbon deposition, over the next dozen years he meticulously crafted each plate to convey the raw human emotions the war had exposed.

Goya finished *The Disasters of War* in 1820, though the collection of prints was not published until 1863 by the *Royal Academy of Fine Arts of San Fernando*. Although Goya likely wanted to publish this series of poignant prints, it was impossible during King Ferdinand's oppressive rule. Despite the delay of their publication, the prints still had a profound influence on many other artists and viewers across the late 19th, 20th, and early 21st centuries, inspiring the likes of Pablo Picasso, Salvador Dali, Otto Dix, and the Chapman brothers ([BBC](#)).

This paper examines how Goya used his firsthand war experience and artistic abilities to create art pieces that showed the everyday realities of war. Unlike many artists of his time, Goya presents an unvarnished depiction of the Peninsular War and its aftermath. Instead of glorifying war heroes, his prints capture tragic events and depict Napoleon Bonaparte's rampage across Spain in all its brutality (Swartz 11). They also shed light on everyday realities of the Peninsular war. The 82 plates that constitute *The Disasters of War* convey an extensive variety of emotions and events, with Goya using artistic techniques such as etching and expressive use of shadow to depict resilience, cruel war tactics/execution methods, and disrespect to the dead.

Resilience (Case Study #1)

A sizable number of the first 46 plates of *The Disasters of War* depict the resistance of Spanish civilians and soldiers. Goya presents many different perspectives that develop powerful ideas of resilience. For example, the second plate, "Con Razón o sin ella" ("Rightly or Wrongly"), depicts two rebels fighting off a row of highly trained French soldiers (Figure 1). The soldiers stand emotionlessly in a line, pointing their bayonets at the poorly equipped Spanish. The only weapons the Spanish are holding are a basic wooden spear and a minuscule pocket knife. Although the drawing depicts the imbalance of power in stark terms, it also shows the resilience of the more feeble Spanish side and their willpower to fight for themselves. There is also a group of civilians standing below the rebels. Although the audience is only able to catch a glimpse of the scene at the bottom, it is evident that the civilians are protesting against the imperial soldiers. An imperial soldier is depicted pushing against a crowd of lightly armed civilians, further fortifying Goya's depiction of violent war conflicts. Taken together, these scenes show that although the civilians are terrified of the superior French side, they still stand their ground.

Goya continues this theme with Plate 4, "Las mujeres dan valor" ("The Women Give Courage"; Figure 2). In this plate, Goya portrays two different outcomes: one with a civilian Spanish woman overpowering a French soldier and vice-versa. The women are wearing casual clothing, reinforcing the fact that they are untrained civilians. Indeed, I believe the title is straightforward, as it represents the women who "give courage" in the sense that they give it their all in the face of adversity. Even in the outcome where the woman is overpowered, she still resists as she grasps the imperial soldier's arm and pushes against it.

Goya follows up with plate #5, "Y son fieras" ("And They Are Wild Beasts"), in which he depicts a small battle with many detailed figures filling up the frame (Figure 3). In this plate, we can see a woman standing fiercely with her body leaning forward with implied confidence. Even

though she is fighting against the superior French imperial soldiers armed with bayonets, she is unafraid and overpowers the French opposition. In the background, her female allies hurl stones and wrestle the French soldiers, just like “Wild Beasts.” All of the untrained Spanish women show perseverance in flipping the script of the battle, and it seems to have paid off, as a heap of French soldiers lay deceased or injured on the ground.

In the next set of plates, Goya alters his approach and motive. Unlike the previous plates, Goya’s 9th plate “No quieren” (“They do not want it”) depicts a woman and her ally fighting off an unarmed soldier (Figure 4). The soldier is not drawing his blade and grasps the woman tightly. His legs are bent and his eyes look down at the woman’s backside. Although we cannot see the woman’s face, her body language suggests resistance through her defensive stance, as she uses her hands to wrestle the man away. Due to this information, it is safe to assume that the woman is being attacked for sexual purposes. To the right side of the main scene, an elderly woman stands next to the brawl, fiercely holding up a pocket knife. She is in a stabbing stance with her arm bent high and her legs bent, ready to strike the malicious soldier. Although the intent of the soldiers is different in this plate, the same theme of resilience is evoked. The two women will not succumb to the malicious desires of the man and willingly fight with their full strength to defeat him.

The 10th plate, “Tampoco” (“Nor Do These”), serves as a sequel to Plate 9, showing an outcome similar to plate #2 but different from the rest (Figure 5). In this plate, we can see half a body and then a large rumble happening in the main scene. It is hard to identify what is going on as the bodies are piled on top of each other in an odd manner. If we look closely, however, we can see that there are women, identifiable by their clothing; we also see that there were no weapons involved. This plate shows a different outcome of a similar event as plate #9, as hinted at by the caption, “Nor do these,” which suggests to the reader the women are being raped and forced into unwanted sexual positions. This pushes Goya’s portrayal of resilience and courage into a more complex meaning. Rather than showing the victory of the resilient women, Goya decides to show the viewer the most probable outcome: The women getting overpowered and raped.

As a primary source and victim of the Peninsular War, Goya has firsthand seen the trauma and evil that war evokes in everyone. This pushes me to believe Goya creates a different depiction in each plate to educate the reader. Unlike many other artists at the time Goya adopted a radically different, original attitude, rejecting the bellicose, heroic, sacrificial, and triumphalist approach, displaying raw emotion and strong resilience that is displayed day by day during the war (Bouvier 1113). He first showed us the resilience of Spanish civilians, and later on shifting his focus onto women and resilience. He shows the reader that even with resilience, the outcome can go both ways; Summarizing that war is something that unlocks a new level of devastation and trauma through each day.

Cruel War Tactics and Execution Methods (Case Study #2)

In the 82 prints that Goya created for *The Disasters of War*, Goya focuses the majority of the first half on showcasing cruel war tactics and killing methods. He starts his depictions of cruel war tactics and execution methods with commonly known tactics, such as cavalry charge, hanging, and guerilla warfare. He even displays similar tactics from previous plates such as the French shooting line to show repeated use of some tactics. Goya then uses sequential order to build up the intensity of each depiction, making each print more gruesome and malicious than the previous one.

Goya starts his depiction of cruel war tactics with plate #8, “Siempre Sucede” (“It Always Happens”), in which he presents a very common war tactic called the cavalry charge (Figure 6). At a glance, the viewer might first notice a fallen horse crushing a soldier beneath it, then notice the vague etching of the large cavalry charge. The soldiers in the back seem to pay minimal attention to their fallen comrades, and the light sketching of the wind suggests the horses continue to charge at maximum speed. The caption, “It always happens,” likely reinforces that soldiers dying during the charge is a common occurrence that does not need to be investigated. In this case, the other soldiers are expected to keep on charging to make the attack as effective as possible. They were trained to have discipline and perseverance in the attack, and they acknowledged that they would not be aided if they faltered during the vital charge. However, although this might make the attack the most effective, the sacrifice of large numbers of soldiers reflects the harsh brutality and cruelty that war induces.

Goya resumes this theme by showing common execution methods in a pair of plates. In plate 14, “Duro el es paso!” (“It’s a hard step!”), he portrays death by the gallows, a method used frequently on both sides of the war. These executions were done in public, as we can see from the crowd of spectators. By contrast, in previous plates depicting rape, such acts were done in private places as the soldiers were aware of their maliciousness.

Another detail in this etching is each man in simple clothing, with no identifiable differences. By showing no identification factors, Goya focuses on the lack of morality built from the war. The condemned people have unmeasurable amounts of anxiety and fear, as an execution plans the date and time. This would be psychologically detrimental to anybody. Goya started this etching off by foreshadowing the outcome with the two men on the left side. Their bodies are swinging after being hung, implying that they had just passed recently. Then Goya paints the main narrative of the artwork, showing the hopelessness of the living condemned men. His head lies limp and his soft facial expressions show signs of defeat as three men drag him up the stairs abruptly.

In his next plate “Y no hay remedio” (“And There Is No Remedy”), Goya introduces the firing squad (Figure 8). In the etching, it is clear that the tied men are being executed by the firing squad. The stance of the soldiers is mirrored from the soldiers in plate 2; the only difference is the convicted men are tied down, unable to resist. In the main scene, the viewer is introduced to a blindfolded man tied to the pole and another man lying on the ground lifeless. The lifeless man's body is twisted in an awkward position, with his head and right arm jacked to the side and his legs and left arm twisting his lower body the other way. He was likely in the

blindfolded man's position previously, but now that his execution has been performed, they tied down a new person to be executed. Goya etches a rifle that is pointing at the man, though he does not show the slayer in the frame. The perfectly straight rifle pointing at the man, and the professional stance of the soldiers in the back outline the efficient widely used execution technique. Goya forces the viewer to imagine the soldier holding the rifle, he does this by foreshadowing with the line of imperial soldiers in the background. His goal is not to blur the actual execution in his representation but to recognize the ethical ambiguity of viewing and representations of violence (Iarocci 91).

In Plate #17, “No Se Convienen” (“They do not agree”) Goya switches the subject from execution methods back to cruel war tactics (Figure 9). In this plate, rather than seeing advanced weaponry such as artillery and ranged weapons, we are introduced to guerilla warfare. In the main scene, there are two men talking to each other on horses. The high quality helmets and elevated stance suggest the men are likely officers/leaders. One of the officers has their sword pointed at the battlefield and a couple of bodies lay next to them, implying that the two officers are making an immediate battle decision. As the officers are in the midst of giving orders, the soldiers engaging in brutal melee combat lose their lives one by one, signifying that one wrong decision can inflict detrimental consequences.

With his next sequence, Goya introduces two more execution methods, which gradually becomes more gruesome. He starts off in plate #28, “Populacho” (“Rabble”) which introduces mob violence (Figure 10). He uses a generic background with a simple caption, suggesting that he is not showing us a specific event, but rather wants to focus on a recurring everyday struggle. In this plate, we see a man and woman brutally beating a civilian to death. It is likely that mob violence is being depicted as both parties are wearing basic civilian clothing, while wielding unadvanced weaponry. A simple wooden spear/rod is being held, with both perpetrators brutally pounding their might into the civilian on the ground. His feet are depicted as bound together, and his bottoms have been taken off, evincing that Goya is depicting a one sided battle. However, aside from the main scene, Goya adds another component to this print. We see a melting pot of civilians huddled around the scene, all watching in disapproval as the brutal execution is occurring. Although the majority of the audience watches in disapproval, they show signs of relinquishment as none of them oppose the mob; conveying the lack of authority provided and immense threat mobs imposed during the war.

Goya flips the script and introduces the reader to a whole new depiction. His 29th plate, “Lo merecia” (“He deserved it”) portrays a man being dragged around on a thick rope. Similar to multiple previous plates, the victim’s legs are bound, immobilizing them (Figure 11). We also see two dark figures in the background, wielding weapons and in attacking stances. Similar to the previous plate, we see a crowd of people watching in the background, but this time we cannot see their expressions. Goya also adds an uneven background, suggesting that the man is being dragged through jagged terrain. The caption, “He deserved it” proposes the man being dragged must have done something to receive the punishment that he got. Rather than seeing expressions that show no emotion or ones of malicious intent, we are shown a man regretfully

looking back at the victim. The other man dragging the body has a neutral facial expression, showing no hatred but also no signs of remorse. It is evident that the two men had no intent in dragging the man around, but were instead ordered to do so. Goya juxtaposes the two etchings, commenting on the perpetrators in plate 28, and the victim in plate 29. It is hard to conclude who Goya wants to depict as right or wrong as he creates opposite meanings in his grouped together prints, which shows Goya's skeptical stance and his generic rejection of violence and war (López-Alós 161).

Goya shows a completely different atrocity and point of view in his 30th etching, "Estragos de la Guerra" ("Ravages of war"). In this etching, Goya shows the interior of a house, with the walls and furniture collapsing into the interior of the house due to artillery fire (Figure 12). We can see the numerous members of the family deceased, as the rubble and broken pieces cover them. The civilian woman closest to the frame is shown with her legs strewn out and her neck extended as far as possible. Her family members are also discombobulated, with one of them missing a hand, and more members under all the rubble. During multiple sieges in the Peninsular War, the French would unleash powerful artillery and bombard Spanish cities. Although it is unlikely that the family we see were specifically targeted, the details of Goya's print shows the innocent civilians were still smashed into oblivion from the futility of war.

A trio of plates is introduced, this time fortifying the cruel execution methods conducted during the war. In these plates, Goya captions them to express that there was no valid reason for the executions, and they were implemented due to pure malice. In plate #34, "Por Una Navaja" ("For [carrying] a knife") a man is shown deceased with a miniature knife hanging on his neck like a necklace (Figure 13). His back is against a wooden plank, and he is dressed like a priest, while also holding a cross in his hands. Upon further research, it is known that the French prohibited the Spanish to carry weapons in the cities they occupied. Even holding a small knife/weapon could lead to the most gruesome punishments. Instead of other punishments, they insisted on giving the death penalty upon catching Spanish people. In order to show that justice is served, the victims were demanded to wear their reason for execution on their necks. They would have a note written down and the "weapon" hung around their necks; Thus showing that they were executed for breaking French Imperial law. The priest is executed through garroting, where the victim's neck is cranked by an iron cord. In this scene, the man is shown already executed, with his neck tightly strangled onto the wooden plank. Similar to plates 28 and 29, Goya places the victim on a pedestal, with an audience watching. However the widespread sorrow is felt by the whole audience as we see them dangle their heads down and bury their heads in their arms. The priest was likely cherished and influential to the Spanish community. The viewers of the plates are forced to sympathize with the audience of the scene; Feeling sorrowful and lost while watching the unjustified execution.

Goya repeats the previous scene with a different depiction in plate #35, "No se puede saber por qué" ("There is no way of telling why"). The same exact execution method is used, except the number of victims has increased. This time, a pedestal is shown in order to depict that the victims were executed on a platform for an audience to see (Figure 14). Goya's perspective

shows that the victims were likely held above everyone else, having to look down at the intimidating crowd. The priests sit with their heads limp, almost like they are hopeless. The title, “There is no way of telling why,” uses irony to show that the viewer can clearly tell that the priests have a variety of small weapons and artifacts hung on their necks, used to justify their execution.

Goya’s depiction of cruel war tactics and execution methods comes to an end with plate #36, “Tampoco” (“Nor This”). The victim is strewn high up on a tree, and their heads fall down limp (Figure 15). Although the main focus is on the frontmost victim, we can see a pattern occurring in the background: Numerous victims being strewn onto a tree. It can be observed that the closest victim’s trousers have fallen down to his feet, suggesting that he has been strewn up not only for intimidation but also humiliation. On the victim’s right side, we are shown a man who is leaning back, with his eyes admiring the victim and his head resting on his arm. As he lays back relaxed, it is almost evident that the man is proud of his work. Although the etching is meant to be a sequel to the previous two, the reason for execution is not clearly shown. This leads us to believe that Goya wants to inform us that the main objective of the French was to show their superiority by displaying executions to the public.

As one of the most prominent artists of the time, Goya used his artistic abilities to feature the use of cruel war tactics and execution methods in multiple prints. He starts his sequentially ordered plates of commonly known war tactics, such as cavalry charge, hanging, shooting line, and guerilla warfare. Although not stated in the captions, he puts a unique twist on each tactic to reveal the flaws and lack of humanity of these tactics. He also groups together multiple prints, connecting them to the same theme but showing a different scene in each separate print, such as shown in plates 28-29 and plates 34-36. His variety of prints highlight the everyday use of cruel war tactics and execution methods during the Peninsular war.

Disrespecting the Dead (Case Study #3)

A couple of Goya’s prints in the series showcase the disrespect that was shown to the deceased. It is important for the viewer to also note that hostility directed at the dead is by no means a new cultural phenomenon (León 69), and the prints were created specifically to show hostility during the Peninsular War. In these prints, Goya introduces the use of mass burial, stealing the deceased’s belongings, and hanging bodies as “ornaments” (Iarocci 194). Goya continues his use of sequential order, showing a more intense depiction of the dead as his series progresses.

He begins his depiction with plate #16 “Se aprovechan” (“They Take Advantage”). In this plate, Goya switches from the firing squad from plate #15 to the aftermath of a battle. We see four bodies lying on the battlefield deceased, all twisted in awkward positions (Figure 16). Two men have their legs bent into the ground and back leaned back. They are forcefully stripping the clothes off the deceased men, searching for any resources and valuables that might have been left behind. The strength that was exerted in order to lift the deceased soldier’s right arm and the other soldier’s right leg up from the ground shows the massive amounts of tension exerted onto

the men. Rather than stripping the men down for cremation or burial, they are being stripped for their belongings. Since a dead person no longer holds value for the war effort, people only saw value in their previous belongings. Goya gives us a straightforward caption, “They Take Advantage,” clearly describing the men taking advantage of the deceased soldiers. Practices like this were extremely common during the war, as the deceased were only seen as resources to help and not as someone who should be memorialized.

He continues his depiction of the dead with plate #18, “Enterrar y callar” (“Bury Them and Keep Quiet”). Following his previous structure, Goya continues his theme of quick disposal, however he changes the scenario to show a different reality that likely occurred. He repeats the portrayal of a field of deceased people, scattered all over. However this time, rather than showing people abruptly looking for resources, we see two people weeping over the dead bodies. Although the duo likely wanted to memorialize the deceased, the caption, “Bury Them and Keep Quiet,” proposes that the civilians were ordered to not speak of the deceased, but rather to dispose of the bodies as soon as possible.

In plate #27 “Caridad” (“Charity”), we are shown a vast number of dark shadows depicting a deep hole. There are strewn down bodies being pushed down the hole abruptly, introducing us to the first burial scene (Figure 18). Before the war, it was common for the deceased to get proper respect with things such as rituals, carefully treating the remains, and giving a proper burial. However, these men and deceased civilians are not being buried for memory but in order to prevent disease. In the frame, we can see a man vomiting on a deceased body, showing clear signs that the bodies hold no value and deserve no respect. Also, the bodies are being thrown at great heights, which would greatly damage the remains on impact. People of both sides of the war were ordered to dispose of the dead bodies as soon as possible, and mass burial sites were created for efficient disposal. Not only was necro violence efficient but it also allowed the perpetrators of violence plausible deniability of inflicting disrespect to the deceased bodies (León 71).

When we take a leap to plates #37 and #39, Goya displays a whole new stage of utmost disrespect to the deceased. In his 37th etching “Esto es Peor” (“This is worse”), he depicts a man's body and genitals being impaled by a sharp tree branch (Figure 19). The perpetrators have hung him in order for the body to be seen: a man being anally penetrated by a tree branch. They are mocking the man in a sexual manner, and his body is mutilated with his arms being cut off. Although the image is wildly gruesome, the man is assembled in a unique way. The man is depicted having an elongated neck and a sunken lower body. His head faces the viewer, although his body faces the opposite side. The use of elongated limbs and odd angles is a technique called twisted perspective—pointing the person's body away from the viewer but showing a perspective where they are looking at the viewer. The man is almost looking at the viewer to receive sympathy. The limbs of the body are so out of proportion that the reader can imagine how much it has been damaged by the perpetrators. In the background, Goya shows imperial guards battling against Spanish guerilla fighters. We can make this assumption due to the similarity in the imperial guards hats from previous plates and the typical Spanish Guerilla fighters. Another

imperial guard is dragging a deceased Spanish fighter, who will likely also be humiliated. Based on the background scene, the audience can make out that the professionally trained imperial guards reign superior, and likely penetrated the dead bodies to humiliate them and send a message of superiority.

Goya continues showing us the mutilation and use of dead bodies to show superiority in plate #39 “Grande Hazaña! Con Muertos!” (“What a Great Deed! With corpses!”). This is his second last etching of the brutality of the war, and he ends it off with one of the most spine-chilling etchings of the series (Figure 20). In this scene, the audience is introduced to three different bodies, each of them strewn to a large tree. Goya starts the etching off with the least gruesome body on the left. The victim is dead but his legs are hung on the tree, with his limp neck resting on the ground. To his right side is the second body: the man's clothes have been stripped off, and his neck is also limp. His torso is extended out due to the odd way he has been tied, and almost every part of his body is bound to the tree, signifying that he has no chance to escape. Finally, on the furthestmost right side, the audience is introduced to a gruesome mutilation: a body being dissected into three different portions. The head is being inserted in a thin stick, and both of the arms have been cut off and are strewn together by a string and hung up as a pair on the tree. The rest of the man's body dangles from the tree, with a string on each leg keeping his body on the tree. Goya's caption, “What a great deed! With corpses!,” uses dramatic effect and irony to describe the event. He is describing the event as a “Great deed” or a mastercraft. However, he adds the part that the perpetrators used the dead bodies in order to create the “art.” The way the bodies were placed was done in order to humiliate the dead bodies, it is seemingly as they have been used to decorate the tree and used as art. Similar to plate #37, the victims are strewn up high and used as a display to be shown to everyone as a symbol of superiority.

Goya uses twisted perspective, irony, and different depictions of dead people to give the audience a first person point of view of the different ways the deceased were disrespected. He starts his depiction by presenting plates 16 and 18. In these plates, he educates the audience that the deceased of the war were often only seen as resources to help the living, and people who were dear to them. He then introduces the 27th plate, which depicts the lack of proper burial during the war. His depiction ends with plate 37 and 39, which display the use of the deceased as decoration and a symbol of superiority. Although each print shows a different realistic scene, they all highlight the gruesome events and lack of commemoration involving the deceased.

Conclusion

Inspired by his firsthand experience of the Peninsular War, Francisco Goya uses the 82 prints that make up his *Disasters of War* to convey the plight of the Spanish people. Goya depicts the resilience of the Spanish people in the face of adversity by not only showing the small victories of the Spaniards, but also the resilience of the Spanish in the face of defeat; convincing the viewer that the Spanish were victims of the French rampage despite their continuous resilience. He then portrays the cruel war tactics and execution methods by sequentially showing

them from least to most gruesome, illustrating that the Spaniards were victims of ruthlessness. He then showcases a multitude of ways disrespect was shown to the dead in sequential order, concluding that the way the deceased were treated during The Peninsular War was tremendously inhumane. Although each print presents a discrete scene, they draw on these themes to showcase the horrors of the Peninsular War and its aftermath by capturing the trauma of the disasters enacted upon the Spanish people every day.

How does Immigration Affect the Economy of A Country? By Elliot Macleod

Abstract

This research evaluates how immigration impacts the economy of a country. Within this topic, I explore how the wage levels, unemployment rate, and GDP per capita of a country can vary with immigration. I further discuss various policies that aim to support the U.S. economy, specifically in terms of economic growth. All of these topics will be explored via academic research, news articles, and economic data. In the end, this paper seeks to validate or refute claims about the economic impact of immigration, including the value immigration provides to an economy. I concluded that immigration does, in fact, largely benefit an economy despite some controversy around the topic. As immigration rises, there are a wealth of reasons why wage levels and the GDP per capita rise as well, including the addition of numerous highly skilled workers and the fact that gaps in the labor force have been filled. Moreover, I discovered that unemployment rates are inversely proportional to immigration. Although some American-born laborers' jobs can be displaced, entrepreneurial immigrants can create opportunities, and there is a need for additional services to support these immigrants. In this paper, I also discuss a few policies that could be introduced to support the U.S. economy financially. Increasing the number of visas available to highly skilled immigrants will allow the country's innovation and STEM sector to keep on growing whilst retaining foreign-born graduates, which will raise the GDP per capita and wage levels. The number of temporary workers can also be added, who will undoubtedly aid economic growth without becoming naturalized citizens.

Introduction

Millions of people internationally immigrate to new countries each year. Whether it be infants or senior citizens, hundreds of millions of people internationally transverse country borders for one reason or another. Stimulants of immigration can be split into two categories: pull factors and push factors. Pull factors are aspects of a country that attract people to it, such as job opportunities, well-respected universities, and high quality of life. On the other hand, push factors influence people to leave a country, including conflict (war), a lack of job opportunities, a lack of services, and a low quality of life. In 2021, there were 1.5 million immigrants to the U.S. alone. This figure mainly consisted of young adults moving either for work (42%) or school (32%), in addition to many immigrating to reunite with family (23%)¹⁸. These are examples of pull factors attracting people to the U.S. However, this composition of immigrants can vary widely across the globe. For instance, in Lebanon, a large percentage of immigrants have fled there as a result of war, including 1.5 million Syrians and nearly 500,000 Palestinians. This is an example of immigration caused by push factors.

¹⁸ "Why Do Immigrants Come to the U.S.?", U.S.AFacts, August 1, 2024, <https://usafacts.org/articles/why-do-people-immigrate-us/>.

Countries inevitably have vastly varying approaches to and opinions on immigration. Countries including Australia, the U.K., and the U.S. are generally very open to immigration, and their societies feel positively about it. Australia, the U.K., and the U.S. have immigration approval ratings of 64%, 64% and 59% respectively.¹⁹ On the other hand, Italy, Greece, and Hungary do not view immigration favorably. In Italy, 54% of the population view immigrants as a hindrance, while only 12% believe that they strengthen the country. Similarly, in Greece, 74% think immigrants are a burden, and 10% view immigrants as beneficial. Despite this, these societies are generally opposed to immigrants, and their country's policies are still very relaxed. 10% of Italy's population, 13% of Greece's population, and 6% of Hungary's population are composed of immigrants. There are also diverse immigration policies throughout the world. For example, even though the U.S. has the largest number of immigrants in the world, and residents feel generally positive about it, it is very hard to obtain permanent residency without family relations. Therefore, even very highly skilled immigrants who would contribute a lot to the economy and society may be denied permanent residency. On the other hand, countries like Canada and Australia admit immigrants mainly based on employability. Both countries used a merit-based point system that takes into account education, language skills, and employment history.

With immigration undoubtedly comes several consequences, and this paper will primarily focus on the economic effects. A long stood-by stance is that immigration hurts a country's economy and that immigrants "take" residents' jobs. As President Trump said in July 2015, "They're taking our jobs. They're taking our manufacturing jobs. They're taking our money. They're killing us."²⁰ Further to this, some economic theories even suggest that immigration may damage some aspects of the economy. However, through the exploration of the truth of the economic effects of immigration, this research supports that immigration is largely beneficial and can positively transform a country. This paper will also explore how the U.S. specifically can implement various policies to optimize immigration for their economic benefit.

Economic Effects of Immigration

Immigration has numerous effects on economic indicators including wage levels, unemployment, GDP, and GDP per capita. This research will initially discuss the economic theory of immigration and these indicators before discussing what happens in reality.

Economic Theory of Immigration

Wage levels, in theory, should decrease with immigration. As immigration occurs, the size of the workforce, also known as labor supply, increases. As seen in Figure 1 below, this will cause the labor supply curve to shift right. Therefore, as the number of workers increases, whilst the number of jobs (i.e., labor demand) stays the same, employers can choose who they want to

¹⁹ Rosenberg and Rosenberg, "Around the World, More Say Immigrants Are a Strength Than a Burden," April 14, 2024.

²⁰ Hoban, "Do Immigrants 'Steal' Jobs From American Workers?"

employ. Consequently, current employees lose their bargaining power for higher wages, as many immigrants are willing to work their jobs for a lower wage. As a result, employers will inevitably either hire these immigrants who work for a lower wage or lower the wages of their current employees. This should, in turn, result in a decrease in the equilibrium real wage, as marked by W_1 .

Figure 1

Wage levels are also closely linked to unemployment rates, calculated by the equation displayed in Figure 2. Unemployment is defined as when an individual is willing to and actively seeking work but does not currently have a job. As immigration occurs and the size of the labor force increases, if the demand for labor doesn't increase at the same rate, the unemployment rate will increase. This can pose significant problems socially as the government will need to invest in housing for unemployed people if they don't have savings or risk a huge homelessness problem. Alternatively, if there is a large demand for labor in an economy, and immigrants can rectify this situation, then the unemployment rate should decrease as the number of unemployed persons stays the same whilst the total labor force increases. However, this situation is almost always impossible as it is rare to have enough labor demand to employ all immigrants, as well as the fact that the immigrants may not be qualified enough for certain positions.

$$\text{Unemployment Rate} = \left(\frac{\text{Total number of unemployed people}}{\text{Total size of the labor force}} \right) * 100$$

Figure 2

Other widely used economic indicators are GDP and GDP per capita. GDP stands for gross domestic product and can be calculated as shown in Figure 3. Consumption includes total

planned spending by households on domestic goods and services, while investment is spending by firms on capital goods, excluding financial assets and wages. Government spending is spending by the government on goods and services, and net exports are the total value of exports minus the total value of imports. As immigration levels rise, the GDP should also increase. Consumption will greatly increase as immigrants will unavoidably have to spend on necessities such as housing, groceries, and more. Furthermore, government spending will rise for various reasons, including the need for more government-funded housing, expanding the capacity of public transport, expanding health care programs, and increasing the size of schools. However, investment is not likely to increase hugely as a result of immigration, but firms may increase office space to accommodate new migrant workers. Additionally, there likely wouldn't be a great effect on the country's net exports.

$$\mathbf{GDP = C + I + G + (X - M)}$$

In other Words

$$\mathbf{GDP = Consumption + Investment + Government Spending + (Exports - Imports)}$$

Figure 3

On the other hand, although the GDP will rise, the GDP per capita, which can be calculated by dividing the GDP by the total population, may fall. If the GDP per capita of immigrants is less than the country's GDP per capita, the figure will go down. In other words, if immigrants make a below-average economic contribution to society, the GDP per capita will fall. This can be the case if a large share of the immigrant population is low-skilled and cannot hold high-paying jobs, thus they will not be able to contribute greatly to the GDP. Furthermore, if there is no demand for labor, this will lead to increased unemployment, as mentioned before. Therefore, immigrants will not have any money to spend to stimulate economic growth and a corresponding rise in GDP. However, immigrants who are highly skilled and make lots of money will increase the GDP per capita. Similarly, immigrants who start businesses or create jobs in another way will increase the GDP per capita.

Observed Economic Impact of Immigration

As discussed previously and according to economic theory, an increase in immigration should lead to decreased wage levels. However, the figure below, which compares the U.S. wage levels to the total number of immigrants, contradicts this statement.

Figure 4

In Figure 4, there is a weak positive correlation of 0.26 between the real wage levels and the number of immigrants, excluding the years 2020 and 2021 due to Covid-19. While there is no strong correlation between the two factors, we know that the number of immigrants is not a direct causation of the change in wages; rather, it is just one of many factors. However, there are still many reasons why wage levels have increased with immigration. For example, while not all immigrants entering the U.S. have obtained a college degree, the immigrant population, in general, is more likely to have a college degree than native-born U.S. citizens. This high level of educational attainment directly transfers to immigrants earning high-paying jobs, thus increasing wage levels. This is especially evident in the lucrative STEM (Science, Technology, Engineering, and Mathematics) fields, as 25% of these workers are foreign-born.²¹ Furthermore, more than 50% of graduate students studying math, computer science, or engineering were foreign-born, and most of them stayed in the U.S. after graduation.⁴ This field, dominated by immigrants, has massive earning potential for students and would undoubtedly increase wage levels. In addition, as the size of the labor force grows, the wage level should decrease as immigrants are willing to work for less, according to economic theory. However, a 2009 study conducted by economist Giovanni Peri showed that immigrants have pushed natives up the job ladder.²² As immigrants filled manual, lower-paying jobs, many native-born people were promoted to higher-paying jobs

²¹ "BEME News, "The Economics of Immigration."

²² "MIGRATION: The Economic Benefits of Immigration."

where their language skills gave them an advantage. As a result, this leads to an increase in wage levels. Although this scenario may be true in some cases, it must be conceded that this promotion through companies is not always possible as, in most cases, new positions cannot be created so easily.

Another discrepancy between the economic theory of immigration and what happens in actuality is the effect of immigration on unemployment rates. Economic theory suggests that as the labor force increases due to immigration, unemployment rates should also increase. Similar to wage levels, this concept is refuted in Figure 5 below.

Figure 5

Figure 5 shows that as immigration increases, the unemployment rate has decreased. There is a weak negative correlation of -0.5 between the two variables: Number of Immigrants and the Unemployment rate. Evidently, this is in stark contrast to economic theory. However, although the overall unemployment rate has gone down, it is still true that lots of American-born workers have lost their jobs. This is a consequence of a disproportionate number of immigrants with few qualifications, causing the size of the low-skilled workforce to increase by 25%.²³ This means that natives are being forced out of their jobs or their income is disappearing, as suggested by economic theory. Despite this, these low-skilled immigrants have also filled gaps in the labor market by working jobs that are less desirable to Americans, such as house cleaning. In addition, immigration provides an opportunity for job creation. Immigrants can indirectly create many jobs as more people will inevitably be employed to build their homes, set up the electrical

²³ "BEME News, "The Economics of Immigration."

system, and teach their kids. Additionally, immigrants can directly create jobs by starting companies. According to a 2017 study by INC, U.S. immigrants are twice²⁴ as likely to start a business and are key innovators in the economy. For instance, if a doctor moves to America, they may start a practice that will employ nurses, administrators, janitors, etc. In turn, this creates many jobs and, therefore, will reduce the unemployment rate. This undoubtedly ameliorates the unemployment rate and proves how immigrants can be so beneficial in creating jobs. On the other hand, these highly skilled immigrants are complemented by other hard-working but lower-skilled immigrants. The culmination of these factors leads to a decrease in the unemployment rate, contrary to economic theory.

In contrast to the previous two economic indicators, the actual effect on GDP is similar to economic theory in that it increases; however, contrary to theory, GDP per capita increases as well. This is displayed below in Figure 6.

Figure 6

There is a weak positive correlation of 0.32 between the GDP per capita and the number of immigrants, once again excluding the years 2020 and 2021. Whilst this graph does not display a strong relationship, we know that the immigrant population is not the main factor driving GDP per capita but is rather just one element that can cause change. Despite this, there are still multiple reasons why immigration contributes to the rise in GDP per capita, including an increase in consumption and government spending. Moreover, it has also increased as a result of increased wage levels and lower unemployment. With increased average wage levels, there is more disposable income that will be spent, increasing the average consumption. Further to this, there is more taxable income, which enables the government to increase spending. Specifically,

²⁴ "Immigrants Are Far More Likely to Star New Businesses Than Native-Born Americans."

highly skilled immigrants make the most economic and fiscal contribution. Their high salaries mean that they pay more in taxes and spend a lot more than the average American, thereby raising the GDP per capita by contributing to both consumption and funds available for government spending. In addition, immigrants will usually arrive as adults, with the immigrant population median age in 2022 being 47,²⁵ and therefore are less costly to services as they don't require schooling and are less likely to have health problems that require hospital services. However, lower-earning immigrants can only make a net lifetime economic contribution if they leave before retirement. This is because, as senior citizens without a job, their income is taxed at a much lower rate, and they are also likely to require more aid from the government due to health problems.

As evinced by the positive impact of immigration on these indicators, immigration can be very economically beneficial for a country in reality, which is contradictory to economic theory in some cases. However, it is important to state that the immigration figures and information used above likely do not provide a fully representative picture as they do not account for illegal immigrants. Furthermore, as immigration rises to extreme numbers, other economic and non-economic concerns could become a factor for society, including overcrowding and the spending of taxpayer dollars on immigration programs.

How to optimize immigration policies for economic benefit?

Currently, there are a variety of ways to immigrate to the U.S.. Just over 1 million people immigrated to the U.S. in 2023.²⁶ This figure does not include unauthorized immigrants, although it is estimated that there are a total of 11.4 million residing in the U.S. currently. The 1 million immigrants who came to the United States in 2023 mainly consisted of young adults moving either for work (42%) or school (32%), with also many immigrating to reunite with family (23%)²⁷. There were also a smaller number of visas awarded for other reasons (e.g., the U.S. Diversity Visa Program), in addition to a significant number of immigrants gaining temporary residency via work or education visas. There are several problems with the current framework by which immigrants can earn residency in the U.S. Apart from the fact that there can be an enormous backlog in applications for these visas, there is an evident emphasis on admitting people for family-based reasons. This strategy perhaps does not optimize economic growth in the U.S..

There are numerous changes that can be made to ensure the utmost benefit to the U.S. economy. Firstly, the U.S. should work to increase the number of highly skilled immigrants, especially those who strive in STEM fields. It is undeniable that this field is extremely lucrative and ever-growing; therefore, it is essential to inject workers into this sector continually. The U.S. will not be able to keep up with foreign powerhouses without a high number of highly skilled workers in STEM fields, and immigrants can be a leading solution to this problem. Further, the

²⁵ "Frequently Requested Statistics on Immigration."

²⁶ "Legal Immigration to the United States," n.d.

²⁷ "Why Do Immigrants Come to the U.S.?", U.S.AFacts, August 1, 2024, <https://usafacts.org/articles/why-do-people-immigrate-us/>.

U.S. Bureau of Labour Statistics projects that STEM occupations will grow twice as fast as the total for all occupations by 2029.²⁸ It is already evident that immigrants have made enormous strides in the U.S. economy as a whole, irrespective of STEM fields: 44% of Fortune 500 companies were founded by immigrants, and those companies employ 13.7 million people.²⁹ There are a few solutions that would make the U.S. more accessible to these highly skilled laborers. Firstly, the U.S. should aim to reduce the green card backlog for foreign-born professionals. The current wait times can reach up to several years, and it is very difficult to obtain a green card in the first place. The U.S. should increase its annual limits of employment-based green cards, which currently stand at 161,000, and also allow temporary workers to remain if caught in the backlog. Furthermore, the U.S. should strive to make it easier for foreign-born graduates of U.S. universities to stay, as this would certainly increase the number of highly skilled immigrants and the country's return on their investment in public universities.

The U.S. could also expand opportunities for temporary workers, who would be able to fill large skill gaps and contribute vastly to the economy without necessarily committing to permanent residency in the U.S.. This could be done by increasing the number of H-1B specialty occupation visas. These visas are available to those with high educational attainment, with at least a bachelor's degree, wishing to perform services in a specialty occupation. The increase in the availability of these visas could create 1.3 million jobs and add an estimated \$158 billion to the GDP by 2045, as indicated in a study by the American Immigration Council.¹² The number of these temporary immigrant visas can be adjusted according to changing skill gaps.

Although the addition of highly skilled immigrants will boost economic growth greatly, the contribution of lower-skilled immigrants must not be underscored. As mentioned previously, lower-skilled immigrants also provide a wealth of benefits, including filling unwanted jobs and creating other occupations, as well as economic growth. If the United States ignores this demographic, there may be potential complications. There could be an oversaturation in the number of workers in one specific sector, even if the workers are highly valued, as well as a lack of low-skilled laborers. Canada, which has been known to prioritize highly skilled immigration, has fallen victim to a lack of labor in lower-skilled industries. As a result, in recent years, they have introduced several policies in an effort to revitalize this population.

This research suggests that the economic benefit of immigration can be maximized in the United States through the implementation of the abovementioned policies. Increasing the number of highly skilled immigrants will be instrumental in economic growth as well as the number of temporary workers, as they will certainly cause an increase in the average wage level as well as the GDP per capita whilst decreasing the unemployment rate. Certainly, an increase in the number of employment-based green cards will assist this situation, as well as make it easier for graduates of U.S. universities to remain in the country. However, it is still essential to still have an inflow of low-skilled workers to complement the high-skilled immigrants.

²⁸“CEO Principles for Making Immigration Work for America.”

²⁹ “CEO Principles for Making Immigration Work for America.”

Conclusion

In conclusion, my research has indicated that immigration is largely beneficial for economic growth. Although economic theory suggests that as immigration increases, wage levels and GDP per capita should decrease and unemployment rates should increase, the opposite has occurred in recent U.S. history. This research shows a weak positive correlation between immigration and wage levels and GDP per capita and a weak negative correlation between immigration and unemployment. Despite the fact that immigration and these economic indicators are not directly related, there is still a wealth of evidence and information to suggest that immigration has positively impacted these factors. An influx of highly skilled and entrepreneurial immigrants has helped to improve wage levels and GDP per capita. Further to this, as most immigrants arrive at working age, they do not require schooling and are a minuscule financial burden to the government. This research also suggests that immigration creates jobs, either through immigrant-founded companies or the requirement for additional services. In addition, as immigrants fill lower-paying jobs, native citizens can be promoted as a result of the ability to utilize their language skills, which have, in fact, contributed to an increase in wage levels. While immigration is largely economically beneficial, too much immigration can become a social burden due to general overcrowding, making everyday life more challenging.

In order to optimize immigration for economic success, the government can focus on a handful of policies. An increase in the number of highly skilled immigrants would allow the U.S. to keep progressing in lucrative STEM fields while skyrocketing the wage levels and GDP per capita. This can be done by increasing the number of green cards available on an employment basis, which would also make it easier for other foreign-born U.S. graduates to remain in the U.S.. Adding to this, the skills of temporary workers can be maximized by increasing the number of H1-B specialty occupation visas. As well as the enlargement of high-skilled workers, the U.S. should still aim to keep a steady flow of low-skilled workers in order to ensure there is still enough labor to perform all tasks.

Regardless of the economic prosperity which arises through immigration, it has been a widely contested topic politically because of its socioeconomic and humanitarian implications. It is important to discuss and research such a relevant topic to unearth its several benefits whilst debunking the myths which accompany it.

From Black Seminoles to Mascogos: Changing Identities Across Multiple Cultural, Political, and Social Frontiers By Royce In

Abstract

This paper explores the transformative journey of the Black Seminoles, a group of African-descended people intertwined with the Seminole tribe, who undertook a historic migration across cultural, political, and social frontiers in pursuit of freedom. Driven by displacement and oppression, the Black Seminoles navigated a series of migrations from Florida to Oklahoma and eventually to Mexico, where they evolved into the Mascogos. Through detailed analysis, this paper examines the identity shifts the Black Seminoles experienced as they faced frontiers that demanded adaptation and resilience. The research underscores how the Black Seminoles' perseverance and eventual autonomy impacted both African American and Mexican communities, serving as a symbol of hope and a foundation for cross-cultural legacy. This narrative of resilience reveals how the Black Seminoles overcame the complexities of shifting national identities while carving out a legacy of strength and freedom.

Introduction

General Andrew Jackson's first war against the Seminole Indians of Florida in 1817 formed the basis for his reputation as an Indian fighter and eventually the foundation for his presidential campaign. During this war, Jackson infringed upon the geographic frontier of Spain in Florida and carried out military actions against the native population of the region. While the word "frontier" is defined here as a location on the edge of one's territories, the term can be broadly applied across the political, cultural, and social spectrums to emphasize new experiences and environments in these domains. Just as Jackson pushed into the Spanish frontier of Florida to fight the Seminole Indians, the Seminole Indians also experienced a new political frontier in their efforts to preserve their nationhood against the American general's intrusion. Jackson's military campaign would eventually have enormous consequences on the Seminole Indians, including their removal from their homelands in Florida. Furthermore, the forced Seminole diaspora would have a particularly momentous impact upon a subgroup of Seminoles, the Black Seminoles, and cause them to undertake a journey that would cross geographic borders, force them to endure cultural changes, and compel them to undergo societal shifts. The experience of the Black Seminoles as they crossed these three frontiers would eventually come to redefine and restructure their identity as a people.

The Black Seminoles were referred to as "Freedmen," a nod to their descent from African American ancestry ("Freedmen History"). These Freedmen worked together with native Seminoles to build alliances for peace. In their early years, during the temporary British colonization of Florida from 1763 to 1783, the Black Seminoles, who were subject to slave laws, were purchased by Seminoles to be freed (Dixon 15). Unlike Spain, the British had not yet banned slavery. The Seminoles and the Black Seminoles agreed to a tribute system that guaranteed Black Seminoles freedom in exchange for a portion of their crops and produce (16).

The friendship and trust between the Freedmen and Seminoles “provided the foundation for what would later become the Seminole Nation” (10). As the native Seminoles and the Freedmen created closer ties, life in Florida gave the escaped slaves the community they previously never had through free settlements such as Angola and St. Augustine, which housed free blacks far away from white populations (12). These homes for blacks were near Native American Seminole villages, allowing trade and cooperation with the natives. The Black Seminoles possessed weapons, had jurisdiction over employment, maintained their own lands, and survived together as individual communities (Etienne-Gray). Their removal from their lands to Oklahoma would force them to endure new political and social frontiers for their community.

The Trail of Tears

However, while the inter-Seminole alliances became stronger, diplomatic ties with the United States deteriorated after the pressured signing of a Seminole removal act in 1833 leading to a new frontier in US policy (“Indian removal”). In 1835, Jackson ordered an invasion of Florida, sparking the Second Seminole War, which became a turning point for Black Seminole freedom. Resistance from the Seminole nation was fierce, with American soldiers claiming the Seminoles were “amongst the most intelligent of the red men on our borders” (McCall 140). The Black Seminoles adapted to a new frontier and lifestyle of warfare and survival, as being a prisoner of war would mean a return to slavery. In a statement to the War Department, American General Thomas Jesup warned “[the Second Seminole War] ... is a negro and not an Indian war,” an indication of the pressure and burden placed upon the Freedmen (qtd. in Porter “Negroes and the Seminole” 427). Black Seminole freedom was at risk and the Americans knew it. The land of Florida was not only the Seminole home, but a warzone for Black pride and justice.

At the conclusion of the war, the Seminole nation as a whole was forcefully sent to the frontier of Oklahoma. Black Seminoles were removed from their ancestral homes and separated from their tribes (Gershon). The Seminoles had no choice but to surrender their land and livelihoods. It was agreed by the Seminoles and United States government that the Seminoles would share land with the Creek tribe.

Fig 1: Map of the Indian Territory in 1830 as planned by the United States government.

Under the jurisdiction of the Creek Indian tribes of Oklahoma, the Seminoles and more specifically, the Black Seminoles, faced political and social hardships that would leave scars on the population. The Creeks claimed that the Black Seminoles were slaves or descendants of slaves that previously belonged to the Creeks before fleeing to Florida. Due to this declaration, Black Seminoles were forced to work as slaves under Creek masters despite having been promised emancipation in the Seminole surrender to the US government (Porter “The Black Seminoles” 112). Many terrorized freedmen found refuge in bordering Cherokee lands from such compulsion and were considered as “renegades living in Cherokee country” (113). Eventually, the number of Black Seminoles fleeing to Cherokee lands led the Cherokees to state:

Be kind, yet strict in the enforcement of proper regulations—and as for others [Black Seminoles], it is but right that you use the utmost vigilance in ferreting out and arresting all who cannot give a good account of themselves (Cherokee Advocate 3).

Soon, the leader of the Seminoles Chief Wild Cat would travel to Washington to plead for separate land from the Creeks. While the Seminoles and Creeks eventually reached an agreement on January 4, 1845 that established local Seminole autonomy under Creek representation and law enforcement, the Creeks continued to insist that Black Seminoles were ‘Creek Property’ (Porter “The Black Seminoles” 116). Therefore, they could not obtain freedom. The Oklahoma frontier re-exposed these Black Seminoles to slavery and the reality of life for black people in the United States. The majority of Black Seminoles were born free and life in Oklahoma forced them to face a political frontier where their freedom was at stake. The relationship between the Creeks and the Black Seminoles made it so “[the Black Seminole desire for freedom] could not be subdued, nor

[the] ties broken, without a struggle,” (Sprague 309). Furthermore, Black Seminoles also lived in fear of capture and kidnappings by white slave catchers. White slave traders would raid settlements on the reservation during the night to kidnap Black Seminole women and children (Opala). Living in conditions of racism and overt oppression in Indian territory, Black Seminoles became a forgotten tribe, the odd man out among Native American civilizations struggling to survive. As a result, the Black Seminoles were forced to consider new territorial frontiers for a new home: a land far away from harm and prejudice.

Exodus to Mexico

The Seminole escape for freedom began in November of 1849, when a band of Seminoles left the Wewoka Creek Indian reservation under the leadership of Chief Wild Cat and Seminole War hero John Horse. Over the course of 7 to 8 months, the Seminoles traveled south through Texas, surviving the grueling winter and making many stops along the way (“The Exodus”, “John Horse”). The exact number of Seminoles and Black Seminoles that left the Indian reservations is unclear, with some sources saying close to 100 and others estimating a number of around 250 (“John Horse,” Guinn 139). The story of Seminole freedom, although short in words, was a long path of mass casualty and struggle. The mixed group of Seminoles made a dash for the Mexican border amidst pursuit by the neighboring Comanche tribe and white slave catchers. The Seminoles would soon face the dreaded pain of searching this new frontier for safe harbor.

At the end of the exodus, there were 84 Black Seminoles in the mixed Seminole group. With support from the Mexican government, the Seminoles were given money, farming tools, and a “military colony” of 70,000 acres of land, where the men would serve on outposts on the northern border as border guards (Baumgartner). The Seminoles built their early settlement in Coahuila, a northern province near the Texas border. Their settlement was then named “Nacimiento de los Negros,” meaning “birth of the blacks” (White). The creation of the settlement, along with the previous 1829 abolishment of slavery in Mexico, led to conditions that encouraged the formation of a Southern Underground Railroad (Little). This caused an unprecedented event of runaway slaves fleeing to Mexico in mass numbers, causing the population of Black Seminoles in the Mexican settlement to increase by four times the original number of Seminole migrants (Baumgartner). The community here of Black Seminoles and slaves united as one to become the Mascogo tribe. The frontier these Black Seminoles faced in Mexico built strength and resilience in the people, a valuable tool in such a deserted land. Mexico would be their new home—but at a cost.

Fig. 2: Map of the specific towns and locations the Black Seminoles encountered in Texas shortly before crossing the Rio Grande and into Mexico. Nacimiento de los Negros is seen along the Rio Sabinas, where the Mascogo tribe still resides today.

The Mexican Frontier

The Mascogos faced a harsh reality in Mexico, an entirely new nation to those formerly known as Black Seminoles. Not only was Mexico a geographic frontier, but it bore the essence of a cultural and social frontier too. Barriers were common between the Mascogos and Mexicans who shared little similarities in culture and background. Language and culture made assimilation difficult. Only a few Mascogos spoke Spanish and conversations with outsiders rarely happened. The Mascogos had a hard time outside of Nacimiento and “couldn’t even ask for a chaw of terbacker,” as said by a Black Seminole descendant (qtd. in Baumgartner). Along with this, Mascogos faced a cultural challenge in adjusting to diet. While Afro-American traditional foods which later became known in Spanish as *soske*, a corn drink, and *tetapún*, a sweet potato bread, were brought by the Mascogos, Mexican food was drastically different (Madrid 177). The early Mascogos would often dispose of ingredients such as red beans from the foods that were gifted to them by the surrounding villages (Baumgartner). While foreign food and language barriers initially made life miserable, this cultural frontier was gradually overcome through Mascogo

intermarriage with the locals. As a result, the number of “negritos puros,” or pure blacks, would decrease and the customs of Nacimiento started to blend with its Mexican surroundings (Madrid 177). This mix created a new frontier for Mascogo culture, one that involved baptisms, Afro-American church folk music, and Mexican dancing (Porter “The Black Seminoles” 144). Women dancing in traditional Mexican clothes and singing American Southern church songs became known as “Capeyuye” a tradition that only exists in Nacimiento de los Negros. Led by elderly women, Capeyuye is a fusion funeral celebration that celebrates the dead (Madrid 177). Funerals for Seminole leaders such as one for John Horse in 1876 involved the early versions of this dance and feast (Porter “Farewell to John Horse” 267). The Mascogo people combined their Florida ancestry with their new Mexican environment to create a stable new cultural frontier in Nacimiento.

Additionally, the Mascogo tribe dealt with a political frontier in Mexico. For the first time, with endorsement from the Mexican government, the Black Seminoles had their own free society and a defense force made up of border patrol men. Even under the racist conditions in the military, the Mascogos found ways to impress their commanders while defending Mexican land against recurring intrusions by Comanche forces, white slave catchers, and other invaders along the Rio Grande (Guinn 204). The Black Seminoles earned their respect from many high ranking Mexican officials and became known for their “desire to succeed in punishing the enemy” (Baumgartner). Being a member of the Mexican military in return for Mexican recognition of their land and freedom benefitted both the Mascogos and Mexicans. With their newfound autonomy, the Mascogos developed their own self-government with elected leaders chosen “according to their degree of blackness” (Gil 5). As people that went through horrendous instances of violence and suffering, the Mascogos’ many new frontiers in Mexico allowed them to pursue their dream of freedom. While the frontiers were not for everyone and some willingly went back to enslavement, the Mascogos were protectors for men and women who endured the dark era of slavery and other atrocities.

Conclusion

The story of the Black Seminoles trekking across various landscapes for a better livelihood multiple times is an astonishing feat. Not only were physical borders crossed, but the ideological frontiers of politics, culture, and society also loomed in new lands they settled in. The ability to adapt to these new frontier conditions helped the Black Seminoles survive and defy the many odds placed against them. The impact of their repeated migration can be felt across multiple groups, most notably American slaves and the Mexican people. Before the Emancipation Proclamation of 1863, an estimated 5,000 slaves were able to take the similar route to freedom the Seminoles made (Burnett). Runaway slaves in the deep South dreamed of joining the famed settlement of the Mascogos, which served as inspiration for escape. The other group affected by Seminole migration was the Mexican military, which received a major boost to their border forces. The Mascogos of Nacimiento served the nation well, often carrying out duties to secure national interests and defend against external forces. When John Horse led the

Mascogos to join Mexican rebels in the fight against French occupation in the late 1860s, they earned the great respect of the Mexican people (Gil 4). The political impact and power the Mascogos had on the Mexican military and diplomatic relations with the United States was important for the community to stay alive. These Mascogos, whose roots originated in Florida, created a story of success under impossible circumstances. As a people, they defied odds, broke barriers, and adjusted to foreign environments multiple times. As the Black Seminoles in Spanish Florida, they escaped slave plantations to build a functioning society for acculturation and collaboration with the Seminole nation. After a forced removal to the Indian Reservations, this same group of people adjusted to slave conditions and fought their hardest for the right to freedom. Finally, after a desperate escape to Mexico, they created a beacon of hope from the ground up to liberate and protect slaves and became known as the Mascogo tribe. In the span of nearly two decades, the Black Seminole Mascogos went from refugee status to conductors in the Southern Underground Railroad. This exposure to multiple frontiers over a short period built resilience and experience, helping the Mascogos thrive. The sophisticated nature of the Mascogo culture and lifestyle make them valuable as an African-Mexican group. With the settlement of Nacimientito being the last remnant of Southern African-American culture in Mexico, the Mascogos have effectively created a bubble around their civilization, forever preserving heritage and ancestry. The Mascogos in Nacimientito have shown that by enduring frontiers and welcoming change, freedom and a transformation in identity can be achieved.

Analyzing Ohio Senate Bill 83's Impact on Academic Outcomes By Michelle Huang

Abstract

The increasing prevalence of anti-DEI (diversity, equity, and inclusion) legislation across state legislatures in the United States, particularly in Ohio, has sparked debates regarding the potential impact on institutions of higher education. Ohio Senate Bill 83, for example, proposed measures such as banning mandatory diversity training and restricting the use of diversity statements in hiring and admissions, alongside new requirements for tenure review and university mission statements. This research paper investigates the extent to which these DEI-related policies have been adopted across Ohio's public universities, analyzing both legislative patterns and their implications for academic outcomes. Drawing from public testimony by Ohio students and professors, as well as quantitative data from state universities, the study examines the prevalence of these policies and descriptive statistics on minority representation on campus. By addressing a gap in the current literature, which lacks empirical data on the academic outcomes of DEI legislation, this paper contributes to a broader understanding of how such laws shape the future of higher education.

Introduction

The prevalence of anti-DEI (diversity, equity, and inclusion) legislation in state legislatures across the United States, particularly in Ohio, has raised critical questions about the impact of such policies on higher education. Legislation such as Ohio Senate Bill 83, sought to ban mandatory diversity training and bar diversity statements from being used in hiring or admissions. The bill would also require colleges to institute new post-tenure-review policies, use specific, state-mandated language in their mission statements, and post all course syllabi on their websites. The companion bill HB 151 was introduced in April, and a revised version would allow mandatory diversity training in certain cases and alter wording about banning the use of diversity statements, among other changes ([Lu et al., 2024](#)). These provisions as well as the explicit restrictions of DEI initiatives, academic freedom, tenure protections drew controversy and were viewed as an effort to exert greater state control over universities ([Kamola, 2024](#); [Fite, 2024](#)). This paper investigates the extent to which DEI-related policies are present in Ohio state universities: How common are the provisions contained in SB83 across Ohio universities?

Previous research has examined various aspects of DEI programs, including their influence on hiring practices and student enrollment. Studies have shown that DEI initiatives can increase the representation of minority groups among faculty and students, as well as improve retention and graduation rates ([Dudu, 2023](#); [Marshall, 2024](#)). However, there is a significant gap in the literature regarding the impact of anti-DEI legislation on higher education. Limited quantitative analysis exists on DEI legislation in relation to minority student academic outcomes, faculty dynamics, and overall campus climate, in part due to the absence of data collection. This lack of data makes it difficult to fully understand the long-term implications of these legislative measures. This project contributes to the current discussion by providing a comprehensive

analysis of DEI policy prevalence in Ohio. Moreover, this study provides an overview of various academic metrics, using both public testimony from Ohio students and professors and data from public Ohio universities.

Review of Literature

This paper connects to literature on the history and provisions of anti-DEI legislation, like Ohio SB83 and its iterations, as well as the impact of such legislation on higher education. The anti-DEI provisions include the banning of mandatory DEI programs, the classroom discussion of concepts relating to “unconscious bias” such as racist or sexist systems, outlawing staff strikes, and the implementation of mandatory American history courses (Daniels, 2023; Blake, 2023). The pervasiveness of anti-DEI legislation has been observed through the introduction of 85 related bills across all states and U.S. Congress, 47 of which have been tabled and 14 of which have been signed into law (Lu et al., 2024). From 2023 to 2024, introductions of iterations of Ohio Senate Bill 83, including House Bill 33, House Bill 151, and House Bill 394 all sought the exclusion of diversity statements from hiring and admissions practices (“Ohio State House Legislation Tracker”, 2024; Lu et al., 2024). Iterations across states parallel SB83’s removal of DEI office and programs, hiring and admission restrictions, and the suppression of diversity statements within higher education (Lu et al., 2024; NCSL, 2024). Legislation uniformly propelled by conservative lawmakers across the nation model the curtailment of identity-based preferences, mandatory DEI training, curbing political coercion via diversity statements, and the general abolition of DEI “bureaucracies” (Rufo, Shapiro, and Beienburg, 2023); inclusion of all the aforementioned provisions varies across states, but recent bills all have in common the constriction of DEI program and practices with the intention of influencing enrollment, hiring practices, and curricula.

Similar work evaluating the commonality of the provisions contained in SB83 lack analysis over time, with DEI resistance tracing back to the post-Affirmative Action retaliation of the 60s (Alfonseca, 2024); however, literature analyzing legislative trends dates back to the last two years (e.g. Bryant and Appleby 2024; Lu et al., 2024). Past literature indicates that the influx of DEI legislation has mostly been spurred by the legal precedent set by the Supreme Court ruling appealing Affirmative Action (Aratini, 2024).

Some existing work examines the relationship between DEI programs and hiring policies (Carpenter-Fortin, Bernhardt 2024; Wirick 2022; “The State of Diversity, Equity, and Inclusion Report: DEI Throughout the Employee Lifecycle” 2022). At the university level, a study conducted at UC Berkeley, the sole university which has published the effects of diversity statements on screening, found that at each stage of the hiring process, candidates were scrutinized based on their commitment to DEI; this was integral to their advancement throughout the process of selection. Similarly, those deemed qualified were initially evaluated on the basis of diversity statements (Steven and Komi 2023). This requirement increased female representation by 22 percent, Black representation by 6 percent, Hispanic by 46 percent, and decreased Asian and White representation by 8 percent and 40 percent respectively. DEI practices stem from the

late 1960s, whereas various African American institutions, programs, and departments sprung from the roots of the Civil Rights Movement and continued throughout the 1970s (Golden, 2024), and were eventually integrated with higher education admissions.

The general trend of legislative resistance towards higher education DEI programs could have detrimental effects on enrollment. A survey conducted on 1,000 undergraduate and graduate students concluded that 55 percent would consider transferring following the abolition of DEI initiatives. In addition, 59 percent stated that the lack of DEI programs and initiatives would have impacted their decision to enroll (Bryant, 2023). This suggests that the removal of DEI programs may not only lead to decreased enrollment but also increased student turnover. Recruitment and retention could also be swayed by the accreditation of universities, with accreditation requiring some form of DEI commitment including diverse hiring and recruitment (Cilburn, 2023), with the curtailment of DEI policies ultimately impeding the retainment of students from minority backgrounds. Similar work evaluating DEI practices and programs on student enrollment show a similar effect; DEI initiatives and programs contribute to greater enrollment and retention from minority and first generation students (Green, 2024), in part by offering counseling and financial services (Asmelash, 2023). Similarly, diversity training models and DEI-focused curricula are developed based on educational research (Hill et al., 2024). However, the provisions of SB83 and similar federal measures aim to restrict DEI-related content (Blake, 2023). Much of the legislative discourse surrounding DEI programs touches on the obstruction of the traditional conceptions of merit (Onwuka, 2024) – however, data on the effect of DEI efforts and the enactment of anti-DEI provisions on academic outcomes is ultimately limited (Green, 2024). This paper builds on the established relationships between preexisting DEI practices, programs, and initiatives using data recording academic outcomes in order to outline the possible effects of SB83’s enactment. Behavioral outcomes such as shifts in student satisfaction, engagement levels, and overall academic performance could be significant indicators of the impact of these legislative changes.

Data and Methods

This study takes advantage of several data sources, including public testimony from students and professors on Ohio education bills as well as relevant quantitative data from public Ohio universities. This methodological approach was necessitated by the current lack of data on the effect of diversity, equity, and inclusion (DEI) efforts and the enactment of anti-DEI provisions on academic outcomes. Specifically, the need for future research on DEI policies and its effects on graduation, retention, and hiring outcomes stresses this approach. Analyzing public comments about state-wide legislation helps develop detailed and theoretical experience-based accounts of DEI policy-initiated changes within the hiring system, which can be further corroborated with public university data.

The sample of universities for this research project is limited to the 14 public four-year universities in Ohio. Ohio is chosen because it is one of many states that has recently considered anti-DEI legislation. Ohio's consideration of anti-DEI legislation provides a timely and pertinent

case study that may offer insights applicable to other states facing similar legislative developments.

The selection criteria for focusing on public four-year universities in Ohio is driven by several factors. Public universities typically have greater transparency and availability of data due to state reporting requirements, which is essential for conducting robust empirical analyses (Klein, 2021). Additionally, these institutions are more likely to be impacted by state legislation like SB83, as they rely heavily on state funding and must comply with state mandates. Focusing exclusively on four-year universities allows for a more controlled comparison of academic outcomes, as these institutions share similar educational missions and student demographics. Compared to four-year universities, two-year and private institutions may vary more significantly in their DEI efforts and data availability. By narrowing the focus to public four-year universities in Ohio, this study aims to provide a detailed and specific examination of DEI policy and the impact of anti-DEI legislation within a clearly defined and relevant context.

Public testimony will be included in this paper, as it is readily available online and provides direct insights into public perceptions of legislative changes (S.83, 135th Cong. (2023)). Individuals have the opportunity to testify publicly on specific bills during committee hearings, where they can self-report their names, affiliations with interest groups, and their stance on the bill in question. Testimonies often include open-ended statements that detail the reasoning behind the individuals' support or opposition to the proposed legislation. This qualitative data offers a rich source of information that reflects both personal experiences and professional concerns, making it a valuable component for understanding the broader impact of DEI policies.

DEI Regulations

The provisions that will be the focus of this research project are the primary provisions of Ohio Senate Bill 83 (SB 83). The first policy pertains to the use of diversity statements within the hiring process. Along with SB 83, this policy was included in earlier anti-DEI legislation, like Ohio House Bills 394 and 151 (OH H.B. 394; H.B. 151). Diversity statements are used to outline candidates' commitment towards DEI, with this practice most notably included in higher education, particularly in student admissions and faculty hiring. Ultimately, there exists much variation in the use of diversity statements, making it an interesting policy to analyze.

The second policy is the banning of mandatory DEI training and programs. DEI programs usually require student and staff participation and act as a prerequisite for accreditation, licensing, grants, and enrollment. These bans have been pervasive throughout Ohio legislation like House Bill 394 and House Bill 151, as well as its enactment in legislation in Alabama, Florida, and Iowa this past year (H.B. 33 ; H.B. 151).

The final policy is the abolition of identity-based preferences in admissions and hiring. Selection of candidates is partially predicated on aspects like age, gender, sex, and ethnicity, etc. Provisions advocating for removal of identity-based criteria aim to emphasize meritocratic considerations.

The policy variables were defined as whether each policy was required by the university as of the time of this writing (mid-2024). Since certain departments could require particular policies whereas other departments under the same institution could omit them, I chose to code the variables as present if they were required or mandated in at least one department. On the contrary, if policies like DEI-related curricula and diversity statements were present but not mandated by the University, they would be marked as absent. The presence of policies was marked by a 1, and their absence was marked by a 0.

Enrollment, Curricula, & Hiring

To achieve a better understanding of these universities, I also collected data on graduation, retention, and enrollment rates, as well as information on hiring practices and curricula. Specifically, I analyzed data that are broken down by demographic group: Male and Female, African-American, White, Hispanic, and Asian. Ohio's public universities publish demographic-related data regarding graduation and retention, including among specific demographic groups most dependent on DEI programs. In theory, one might expect a positive relationship between DEI programs and the representation of minority demographic groups in university enrollment.

Similarly, I measure hiring practices by assessing the proportion of certain demographic groups targeted by DEI policies in the make-up of the faculty and staff at universities. The final variable is the presence of mandatory curricula. I examine university credit and course requirements to determine the presence of mandatory DEI-related curricula.

For each of these outcome variables, the latest year recorded (which ranges from 2019 to 2022) is always used. These data were collected from a combination of public university data and college studies conducted by outside entities. Public university data were collected from statistical reports and annual reviews available on their official websites. This included graduation rates and enrollment statistics from institutions such as Ohio State University. Outside entities encompass organizations and research groups that conduct independent studies and publish their findings on higher education. For this study, information was pulled from the National Center for Education Statistics (NCES), the Pew Research Center, and private educational research firms. When calculating averages, I omit missing values. Missingness within the data varies by column, with demographic-related retention and faculty composition rates having the most missingness, and enrollment and graduation rates having the least.

Analysis

Policy Overview

Policies across Ohio's 14 public 4-year colleges include the presence of various programs, curricula, training, and statements ensuring faculty commitment to DEI. Variation exists among these universities in whether or not policies are mandated at the university level, including during the faculty hiring process.

DEI programs notably include scholarships, which are designed to alleviate financial barriers for students; these encompass merit-based, need-based, and targeted scholarships. Merit-based scholarships recognize academic achievement and extracurricular involvement, while need-based scholarships, determined by the Free Application for Federal Student Aid (FAFSA), provide critical support to students from low-income families and provide financial incentives for student enrollment. Targeted scholarships are specifically designed to support students from underrepresented or marginalized communities, focusing on aspects such as race, gender, or first-generation college status, with the goal of enhancing diversity in the higher educational environment (Espinosa et al., 2015).

Similarly, DEI initiatives for faculty (i.e., academic personnel, including tenured professors and lecturers) include the issuing of diversity statements, with the intention of outlining one's plans and commitment to contribute to DEI, during the hiring process, and mandatory cultural competency training (VA S.B. 1196; Minnella, 2024). At the academic level, policies include the integration of DEI principles with curricula through the development of courses and programs focused on social justice, equity, and inclusion ("DEI in Curriculum: Model Principles and Practices", 2022). This academic commitment is complemented by community engagement and outreach efforts, wherein colleges partner with local schools, organizations, and businesses to promote college access and success for underrepresented groups ("DEI Programs Succeed Through Partnerships & Collaboration", 2023; Pasque et al. 2004").

Public Testimony

For the bills that were proposed in Ohio relating to DEI regulations, many students/professors have openly testified in support or opposition in state legislative committee hearings (S.83, 135th Cong. (2023)). The total number of people who supported SB83 is 26, the total number of people who opposed the bill is 588, with 27 others listed as an 'Interested Party.' Breaking it down by whether the individual is a student/faculty (removing those who are unidentifiable), the information indicated that 4/26 proponent testimonies were from teachers, with none from students. Opponent testimony consisted of 6/588 from teachers, and 9/588 from students at either the undergraduate or graduate level, with the vast majority of testimony (415/641) on both sides coming from Ohio citizens who were neither University faculty nor students.

As mentioned in the Data and Methods section, these individuals file written statements. Proponent testimonies mainly argued that the bill would protect intellectual diversity and reduce ideological bias by preventing mandatory DEI training and requiring public reporting of course materials. The majority also supported a ban on faculty strikes to prevent disruptions in education. Opponent testimony mainly centered around preventing the curtailment of DEI efforts, academic freedom, and faculty labor rights as mentioned in the bill's provisions. Opponent testimony from various perspectives commonly cited the fear of stifling important discussions, increasing administrative burdens, and harm to marginalized groups and faculty morale.

Variation in DEI Requirements

There exists variation across the public universities in the kinds of DEI requirements implemented. 42.9% of the universities mandated diversity statements in faculty hiring, 78.6% required faculty participation in the aforementioned DEI-based training, 50% required students to complete DEI-related curricula, but all universities offered DEI programs of some form. Ohio State University, Central State, Cleveland State, Kent State, Miami University, Wright State, and Youngstown State did not mandate or did not disclose the use of diversity statements during the hiring process. Similarly, Ohio State, Cleveland State, Kent State, Ohio University, Wright State, and Youngstown State do not require student completion of DEI-related courses or credits. An example of DEI-related accreditation would be Ohio State University's 12-credit hour certificate focusing on issues related to diversity ("Diversity, Equity and Inclusion"). However, only Kent State, Wright State, and Youngstown state did not mandate faculty training.

Demographic Composition

Using public data available on University websites, as well as *CollegeScorecard.ed.gov*, a government-subsidized University data initiative, I analyzed the graduation and retention rates as well as faculty composition. For Columbus-based, or central Ohio 4-year colleges, graduation rates in the latest recorded years (2019-2022) ranged from 60-80%, which is higher than the average across all 14 public universities (42.9%). The university with the highest graduation rate is Ohio State University (tOSU), whereas the university with the lowest (33%) is Cleveland State. More specifically, Ohio State had a graduation rate of 46.8% for male students and 53.2% for female students, with an 88% Asian & White graduation rate, as well as a 79% graduation rate for Black students and an 83% graduation rate for Hispanic students. In contrast, Cleveland State hosted a 41.5% male graduation rate and 58.5% rate for female students. Ethnically, the graduation rate for White students was 53%, 68% for Asian students, 30% for Black/African American students, and 35% for Hispanic students. According to Table 1, across all universities, the median graduation rate was 47.2%, with rates averaging at 41.6% for males, 57.8% for females, 59.8% for White students, 71% for Asian students, 38.3% for Black students, and 47.2% for Hispanic students. More generally, Ohio graduation rates look similar to the national averages, with respect to all students as well as students in different demographic groups ("College Graduation Rates by Race", 2024). Both in Ohio and nationally, White & Asian students have higher graduation rates than Black & Hispanic students.

As table 1 reads, in terms of enrollment rates, the average across Ohio public universities is 44.2% for males, 55.7% for females, which closely resemble the aforementioned graduation rates by sex. Overall, Ohio University (OU) presented the biggest differences in enrollment by sex, with 39% male enrollment and 61% female enrollment, while Ohio State University presented an even split, with 50% male and 50% female enrollment. By ethnicity, the average across Ohio universities is 62.7% for White students, 3.2% for Asian students, 11.7% for Black students, and 6.1% for Hispanic students.

Demographic	Average Graduation Rate	Average Retention Rate	Average Enrollment Rate
All students	52.2	73.7	21.5
Male	41.6	68.6	44.2
Female	57.8	74	55.7
White	59.8	88.7	62.7
Black	38.3	70.5	3.2
Asian	71	84.6	11.7
Hispanic	47.2	81.7	6.1

Table 1: Average graduation, retention, and enrollment rates (in percentages) across 14 public four-year universities in Ohio, for different demographic groups

Conclusion

This study explored the prevalence of DEI-related policies in Ohio state universities amidst rising anti-DEI legislation. Exploiting several different data sources, I examined committee testimony on Ohio legislation and analyzed data from public Ohio universities to describe current DEI policies, academic outcomes, and institutional practices. The study focused on 14 public four-year universities in Ohio, examining DEI policies such as diversity statements, mandatory training, and identity-based preferences. The results indicate significant variation in the implementation of DEI policies across different universities. Some universities had comprehensive DEI frameworks mandated university-wide, while others had only partial or no formal policies in place. Within institutions that did have DEI policies, there was considerable inconsistency at the departmental level, with some departments strictly enforcing policies while others did not. These results have implications for enrollment, faculty diversity, and curriculum development, given that the presence or absence of DEI initiatives might substantially influence the composition and inclusivity of university environments.

Future research should expand the sample size to include more universities and explore the longitudinal effects of anti-DEI legislation to better understand its long-term impact. Additionally, further studies could investigate the specific mechanisms through which DEI policies affect academic outcomes and institutional practices. Overall, this study highlights the critical role of DEI initiatives in fostering inclusive academic environments and emphasizes the need for informed policy decisions to support diversity and equity in state universities.

This issue has become increasingly important because the presence or absence of these policies can significantly influence the composition of both faculty and student bodies. Restricting these initiatives, as proposed in legislation like Ohio Senate Bill 83, could lead to a decline in enrollment and retention rates, resulting in less diverse academic environments and potentially diminishing the quality of education and University-sanctioned support for underrepresented groups. Specifically, data collected in similar studies shows a positive correlation between the presence of DEI programs and higher enrollment rates among certain ethnicities, along with more diverse faculty representation (Dudu, 2023). Additionally, variations in policy enforcement across departments reveal that mandatory DEI policies have a

more pronounced effect on these outcomes. In general, efforts to curtail DEI programs may lead to reduced diversity among faculty and students and hinder the development of inclusive curricula. These changes could have long-term impacts on the academic success and professional development of students and faculty alike, thereby impacting the broader academic environment in Ohio's public universities.

What Are the Causes and Consequences of Low Fertility Rates in Advanced Economies, and How Can We Combat Them? By Rebecca Rong

Demographic decline: Using progressive policy to combat low fertility rates

Declining fertility rates have been a decades-long major concern for advanced economies, posing challenges and opportunities. These 41 economies, classified by the International Monetary Fund (IMF), and the world overall, are all experiencing their lowest fertility rates in history, measured in total fertility rate (TFR). A TFR of 2.1—the “replacement rate”—is required for a population to be stable. While global TFR was a high 4.5-7 in the pre-modern era, it is now 2.3 and decreasing; for advanced economies, it is even lower, well below replacement (“Global Fertility”). Thus this issue is a worldwide concern, bearing economic and social implications for society such as labor shortages, economic slowdowns, and weakening welfare systems (Ferguson). This essay contends that the causes of low fertility rates—rising costs of raising children and women's empowerment—drive a rapidly aging population. It concludes that nations can address these demographic shifts through progressive social policy and relying on external labor sources, without reversing societal progress.

Causes

The first major driver of low fertility rates is the economic cost of raising children. Economist Gary Becker argues that fertility rates correlate to the demand for children—their “price”—measured by direct and indirect costs (Becker; Roser). Direct costs, such as childcare and education fees, weigh heavily on families' finances. Indirect costs are even more significant, including the opportunity costs when parents—especially women—step away from the workforce during a parental leave period. They can miss out on work experience, skill training and advancement opportunities during this time, which directly impacts their long-term careers and ability to earn more in the future (Roser; Hoem). Contemporary parents may choose smaller families to provide their children with a higher quality of life, reflecting a “quantity vs. quality” tradeoff. In a technology-driven economy, with less child labor, children are considered economic liabilities (Roser). These issues thus highlight a need for policies that support women with financial relief without compromising their career development.

The second factor is the empowerment of women. Research shows an inverse correlation between women's education levels and birth rates in a population. As women gain more freedom, they often choose to have fewer children. More women are now educated on the use of contraceptives; combined with increased access, unintended and teen pregnancies have dropped substantially (Bytyci; Doepke; Ferguson). Chicoine and Bailey emphasize this impact, noting the decrease in unintended births contributed to a nearly one-third decline in US fertility between 2007 and 2016 (Ferguson). Though a contributing factor to declining overall birth rates, this is reflective of fundamental social progress, and something policy responses should continue to support.

A third factor is evolving social norms ("Global Fertility"). Society has shifted to become more accepting of women with fewer or no children (Roser). Lutz et al. argue that as societies develop from fundamental needs to self-actualization, pursuing individual goals, such as furthering careers, tends to take priority over starting families. Other cultural shifts intensify this shift in priorities. Declining sexual activity—caused by sexual conservatism, online entertainment, and widespread mood disorders among young adults—contribute to lower fertility (Ferguson). Many advanced economies have been gradually shedding religious values that have traditionally been pro-natalist, and overall religiosity has been measured as declining (Roser). These three factors reflect evolving norms that lead to diminishing fertility rates.

Consequences

The long-term decline in fertility rates in advanced economies has significant consequences, impacting their economies, social systems, and environments. As the number of working age people relative to retirees decrease, these systems receive fewer contributions, requiring tax hikes or benefit cuts to sustain them (Alvarez; Doepke; "Global Fertility"). This can cause other problems such as delayed retirement, lower real returns for savers, heightened healthcare demands, and other fiscal crises. Assessing economic and social consequences illustrates the need for careful approaches to combat young labor shortages greatly burdening working generations.

Counterargument

It should be acknowledged that lower fertility rates in advanced economies can benefit the environment by reducing total emissions. A 2017 study found that having one fewer child per family in high-income countries could reduce 58.6 metric tons of emissions annually. Since overconsumption in wealthy areas causes disproportionately high emissions and exacerbates climate damage (i.e. in the U.S.), this demographic shift should be paired with sustainable policies that regulate these negative patterns (Keulen). Addressing low fertility rates requires a holistic approach that balances population concerns with environmental sustainability.

Possible Solution: Social Policies (France)

France's approach to combating low fertility, by providing work-related benefits to families that raise children, is a good example of how countries use progressive social policies to address these challenges. This case study highlights France's approach to combating low fertility rates, a model successfully implemented in other regions like Scandinavia (Hoem; Olivetti). France's TFR dropped sharply during the early 1960s to 1.8, prompting a response on multiple fronts: the introduction of social and work policies, increased public spending, allowances, and supportive services. France has one of the highest public spending as a portion of national wealth, offering allowance to households with two or more children. Compensated parental leave for up to three years helps parents, particularly women, remain in the workforce. To alleviate the monetary and temporal costs of childcare, France provides free preschool education and

affordable schooling onwards (Influence; Olivetti). These incentives have made an obvious impact; although still under the replacement rate of 2.1, France's 1.9 TFR is one of the highest among advanced economies, topping countries like Italy and Japan ("Country Comparisons;" "Global Fertility"). The significant discrepancies among the TFRs of advanced economies reveal the importance of such policy. For example, countries like Italy and Japan have extremely low TFRs of 1.26 and 1.4 children per woman, due to a societal lack of attention on childcare (Doepke). By contrast, France and Sweden are higher, at 1.9, and 1.67 due to supportive family policies that help parents balance childbearing with careers ("Country Comparisons;" Ferguson; Olivetti). Thus, undoubtedly, adopting pronatalist policies and developing these areas can greatly improve the TFR of advanced economies while preserving progress towards gender equity.

Possible Solution: Immigration and Technology

The robust current labor demand in advanced economies, aggravated by low TFRs, can be addressed with increased immigration and AI innovation. AI automation can enhance efficiency and productivity, reduce cost, and alleviate the strain on a smaller workforce, including elderly care (Andriole; "Global Fertility"). Meanwhile, immigration, especially of highly skilled individuals, promotes innovation, economic growth, and a sustainable age structure. It also lowers the age dependency ratio, as seen in recent progress in the U.S.. Immigrants, typically younger and with higher fertility, make positive fiscal contributions. Despite its benefits, immigration often faces opposition from aging populations who fear the cultural, economic, and social shifts migrants bring. Older generations may feel that migrants threaten national identity or displace them in the workforce. These fears have perpetuated anti-immigrant sentiment, reflected in pushes for stricter policies controlling immigration and stark divisions. Thus, immigration alone cannot solve demographic issues without forward-looking strategies (Peri).

Low fertility rates in advanced economies result from various economic, social, and cultural factors, significantly impacting economic growth, societal structures, and environmental sustainability. While these changes reflect progress, particularly for women, addressing low fertility requires a balanced approach that reflects individual choice and mitigates consequences. Policy makers must adopt comprehensive strategies to ensure a sustainable population and improve quality of life without reversing positive societal shifts towards women's empowerment.

ATV Injury Characteristics in U.S. Emergency Departments

By Ryan Shams, James Friel, Seth Virmani, Ayush Varma, Nathan Kim

Abstract

All-terrain vehicles (ATVs), off-road vehicles used for a variety of purposes such as recreation, farming, and construction, are prone to rollovers and collisions and often cause severe injuries. There are an estimated 10.5 million households in the U.S. with at least one ATV, and ATVs cause 400,000 injuries and 800 deaths in the U.S. each year. This study was conducted to analyze emergency department visits from 2014 to 2023 following ATV injuries using the National Electronic Injury Surveillance System (NEISS) database, consisting of injury reports from approximately 100 emergency departments across the United States. Existing research in the field has not sufficiently studied injury severity or conducted stratification of the injury data, and this study addressed the knowledge gap within ATV injury research. National estimates with 95% confidence intervals provided by the NEISS database were used to test for statistically significant differences. National estimates show that there were between 815,434 and 1,273,667 (95% CI) ATV injuries. There were more male injuries (561,938-867,419, 95% CI) than female injuries (252,423-407,920, 95% CI). Contusion/abrasion and fracture were the two most common diagnoses. More fractures were seen in the upper extremity (115,209-188,247, 95% CI) than the lower extremity (50,576-83,419, 95% CI). At the 95% confidence level, there were between 112,310 to 249,638 hospitalizations and 924 to 2,237 fatalities. This study's findings can guide the creation of safety education programs and safer ATVs.

Introduction

All-terrain vehicles (ATVs) are off-road vehicles that are used for recreation, farming, and construction. An estimated 10.5 million households own at least one ATV, and ATVs cause approximately 400,000 injuries and 800 deaths per year (R. Constance Wiener et al.). Due to the fact that these vehicles are open air and can reach speeds of up to 80 miles per hour, ATV users are prone to injury (R. Constance Wiener et al.). Most of these injuries come from ATV rollovers and collisions. This is a descriptive, hypothesis-generating study that future studies can build off of.

Despite the dangers that ATVs pose, there is a lack of research done on injury severity and more in-depth stratification. For example, past studies have not analyzed disposition data or compared diagnoses for different anatomical regions (Ganga et al.; Kleiner et al.; R. Constance Wiener et al.). Additionally, these studies do not include more recent injury data, indicating the need for new research in the field (Ganga et al.; Kleiner et al.; R. Constance Wiener et al.). This study analyzed disposition data, compared diagnoses for the upper and lower extremities, and incorporated injury data up to 2023.

The findings of this study can guide the creation of safety features for ATVs and safety measures that can minimize the risk of injury. The study utilized more recent data, covered injury

characteristics that have not been analyzed in previous studies, and validated existing findings in the field.

The primary objective of this study was to identify ATV injury trends that can guide the manufacturing of safer ATVs and the creation of ATV safety measures. The findings can inform users on what injuries they are at most risk of. Another objective of this study was to further support existing claims within the field of research and bring new findings to the field.

This study included all U.S. emergency department injuries following ATV injuries from 2014-2023 in the NEISS database. The study does not represent injuries seen at other sources of care, such as a doctor's office or urgent care, and injuries outside of the United States.

The National Electronic Injury Surveillance System (NEISS), collects ATV injury records across the United States from over 100 emergency departments. Every reported injury is assigned a national estimate, which is the number of injuries it represents nationally based on the size of the emergency department the injured ATV user visited.

We utilized the NEISS Estimates Query Builder to filter the data and acquire the national estimates with their 95% confidence intervals. These national estimates were recorded in a google sheet, and then converted into graphs using the GraphPad Prism 10 software.

Methods

This observational study analyzed ATV injuries using the publicly available National Electronic Injury Surveillance System (NEISS) database, which consists of consumer product-related injury reports from approximately 100 emergency departments across the United States ("National Electronic Injury Surveillance System (NEISS)"). The NEISS database is a nationally representative probability sample operated by the Consumer Product Safety Commission (CPSC) ("National Electronic Injury Surveillance System (NEISS)").

Each injury report in the sample has an assigned national estimate, the number of injuries it represents nationally, calculated by the NEISS database based on the size of the emergency department that the injured ATV user visited. This study used the national estimate data in order to represent all U.S. emergency departments.

This study focused on all ATV injury reports from 2014-2023. This year range was selected to ensure a statistically reliable sample size, and the maximum year range for a NEISS query is 10 years. There were 22,732 cases in the sample, representing between 815,434 and 1,273,667 injuries nationally at the 95% confidence level.

This study measured national estimate data for sex, anatomical region, age, disposition, and diagnosis by querying the NEISS database. We first queried for all of the sample by selecting the 2014-2023 year range, all five product codes for ATVs, all ages, all body parts, all diagnoses, and all dispositions in the NEISS Estimates Query Builder. For the following queries, we filtered those categories to acquire the national estimate data for the different participant and injury characteristics. We recorded the number of cases in the sample, the national estimate, and the coefficient of variation from each query on a google spreadsheet in table format.

After completing the necessary queries and recording the information onto a spreadsheet, we utilized the GraphPad Prism 10 statistical software to create bar graphs using the national estimates.

Since the NEISS database provided 95% confidence intervals, statistically significant differences (at 95% CI) were proven for national estimate ranges with no overlap.

Results

There were a total of 22,732 cases in the sample, representing between 815,434 and 1,273,667 injuries nationally at the 95% confidence level.

There was a statistically significant difference for the national estimate for male injuries (561,938-867,419) being higher than female injuries (252,423-407,920).

Fig 1: National estimates of ATV injuries in men and women. Tick marks represent 95% confidence intervals

Ages were split into three age groups: children (0-17), younger adults (18-34), and older adults (35+). There were no statistically significant differences in national estimates between these three age groups.

Fig 2: National estimates of ATV injuries in children, younger adults, and older adults. Tick marks represent 95% confidence intervals

Contusion/abrasion and fracture were the two diagnoses with the highest national estimates (statistical significance at the 95% confidence level).

Fig 3: National estimates of diagnoses observed in ATV users. Tick marks represent 95% confidence intervals

There were no statistically significant differences for the national estimates between the head/neck, upper extremity, trunk, and lower extremity anatomical regions.

Fig 4: National estimates of injured anatomical regions observed in ATV users. Tick marks represent 95% confidence intervals

The national estimate for fractures in the upper extremity (115,209-188,247) was higher than the national estimate for fractures in the lower extremity (50,576-83,419).

Fig 5: National estimates of diagnoses observed in the upper and lower extremities. Tick marks represent 95% confidence intervals

At the 95% confidence level, there were between 112,310 and 249,638 hospitalizations and between 924 and 2,237 fatalities.

Disposition	95% CI Lower Bound	95% CI Upper Bound
Not Admitted to Hospital	686,106	1,037,755
Admitted to Hospital	112,310	249,638
Fatality	924	2,237

Table 1: National estimates of dispositions for ATV users.

Discussion

There were between 815,434 and 1,273,667 injuries (95% CI). Most ATV injuries occurred in males. Contusion/abrasion and fracture were the two most common diagnoses. There were more upper extremity fractures than lower extremity fractures. There were 112,310-249,638 (95% CI) hospitalizations and 924-2,237 (95% CI) deaths that resulted from ATV injuries.

Past studies on ATV injuries have stated that a higher percentage of ATV users are male than female and that male players are more likely to be injured. This matches the findings of a previous study, Sandler et al., which showed a statistically significant difference in the number of injuries in males and females (Sandler et al.).

The high-speed, open-air nature of ATVs combined with the prevalence of rollovers and collisions is a likely explanation for the prevalence of fractures and contusions/abrasions, as users are exposed to high impacts (R. Constance Wiener et al.). This matches the findings of Sandler et al., who found fracture to be the most common diagnosis (Sandler et al.).

A possible explanation for why there were more upper extremity fractures is that people will outstretch their arms to catch their fall or brace for an impact (Mayo Clinic).

The high national estimates for hospitalizations and fatalities is likely due to the high impact ATV rollovers and collisions.

Given the danger of impacts from ATV accidents as evident by the findings of this study, ATV manufacturers should build roll bars on the vehicles to minimize the impact of rollovers and collisions. Users should drive at lower speeds and on safer terrain with helmets and protective equipment.

There is an academic significance of this study, as the findings match prior studies, further supporting ATV injury data. This study also brought new findings to the field, as it was found that there were more upper extremity fractures than lower extremity fractures and a prevalence of hospitalizations and fatalities.

This study successfully identified statistically significant differences for ATV injury characteristics using national estimates provided by the NEISS database. The findings can be utilized to guide ATV manufacturing and safety measure implementation, and ATV users can be informed of the types of injuries they are at most risk of.

Future research should focus on ATV injuries seen at urgent care or doctors offices to address the limitation of this study and add more knowledge to the research area. In order to identify more statistically significant differences, more precise data must be used. A future study could utilize data with a larger sample size to have closer confidence interval bounds.

The NEISS database is limited to emergency departments, which is a significant limitation of this study. Injuries seen at other places for care, such as doctor's offices and urgent care, were excluded from the study. It is possible that the injury cases differ in other places of care. ED settings capture more severe injuries such as fractures more than less severe injuries such as sprains/strains and bruises ("When to Visit the ER, Urgent Care, or Primary Care Provider"). For this reason, the results of this study can not be generalized to non-ED settings.

Another limitation of this study was the differences between the lower and upper confidence intervals. If the national estimate data was more precise then more statistically significant differences could be identified.

Conclusion

Statistically significant differences for injury characteristics within the ATV injury reports were identified. More ATV injuries occurred in males than females. Contusion/abrasion and fracture were the two most common diagnoses, and more fractures occurred in the upper extremity than the lower extremity. At the 95% confidence level, there were between 112,310 and 249,638 hospitalizations and between 924 and 2,237 fatalities.

The findings of this study can inform ATV users on what types of injuries they are most at risk of. Users should wear helmets and protective clothing to minimize injury risk. ATV manufacturers can design ATVs in a way to minimize the risk of the most common injury types, such as implementing rollover protective systems.

Climate Change and Pharmaceutical Residue: Compounding Effects on Terrestrial Wildlife By Snigdha Tripurari

Abstract

The rising decline in wildlife populations, and biodiversity overall, stems from human development and the subsequent, although sometimes inadvertent, harm to the environment. Amongst the various threats against biodiversity, climate change and pharmaceutical residue are two siloed, yet silently compounding threats that require greater attention. Climate change alone has affected over 11,000 species so far, increasing their likelihood of extinction. The pharmaceutical industry itself generates over 52 million tons of carbon dioxide annually – ultimately contributing back towards climate change. To date, research done on the interaction between climate change and pharmaceutical residue and their individual effects has mostly focused upon aquatic wildlife, leaving very sparse resources on their composite effects together, to expand this knowledge base onto terrestrial ecosystems. As such, this study features a literature review to determine the extent of knowledge regarding this field of study, with a particular focus on terrestrial impacts. It's been found that few studies have demonstrated that pharmaceutical composition is impacted by rising temperatures brought on by climate change. Nevertheless, these effects trickle down across wildlife species, causing hormonal imbalances, reproductive impairment or even mortality. Enforcing tougher government regulations on pharmaceutical waste and increasing education regarding these compounding impacts is a necessity to bring about any positive change.

Introduction

The variety of life forms present on Earth—including a wide range of flora, fauna, fungi, and even microorganisms such as bacteria—and their interactions is known as biodiversity. Understanding how unmanaged human activity affects the planet's ecosystems is crucial, especially when it comes to the effects of pharmaceuticals on terrestrial species, since much little research is available on this topic.

As an ecosystem's fundamental component, biodiversity enhances human well-being by driving and benefitting ecosystem processes. Aside from providing basic necessities like food and water, ecosystems can also regulate natural events like droughts, floods, land degradation, and disease prevention; they can also support cultural activities like nutrient cycling and soil formation; and they can offer non-material benefits like spiritual, religious, and recreational opportunities (National Wildlife Federation). Hence, it is critical that humans maintain the environment and ensure the comfortability of the environment for the survival of interdependent animals and plants.

One of the most pressing issues facing humanity is the loss of biodiversity. The United Nations Millennium Development Goals (MDGs) are eight goals that UN Member States had committed to attempting to accomplish; world leaders pledged to fight against environmental degradation, poverty, hunger, sickness, etc., however, these goals and their broader global effort

to combat biodiversity loss are impeded by the state of the biosphere.

Biodiversity loss is occurring on an unprecedented scale. Currently, the extinction of almost a million plant and animal species is a concern and since 1970, the mean global population of species' abundance has decreased by around 69% (WWF). According to the International Union for Conservation of Nature (IUCN), 41% of amphibian species, 21% of reptiles, 13% of birds, and 26% of mammals are listed as threatened with extinction (IUCN). Driving much of these losses are growing and changing human demands and the verve to meet these demands. While humankind has succeeded in many different efforts to better their well-being, partly using advanced technology, this has been at the cost of biodiversity loss. For example, the constant building of apartments, factories, and power plants while clearing out Greenland containing habitats or degraded land, instead of planting new trees in the area, converting natural areas to farms or damming streams to divert and store water (National Geographic Education). Humans are the ultimate constituent for biodiversity loss, inflicting a variety of environmental threats such as chemical and waste pollution (including pharmaceutical residues), habitat destruction, natural resource overexploitation, and invasive alien species – each of which contribute to environmental degradation (Summers et al. 327–340). Amongst these threats, climate change is now rising as the major contributor of biodiversity loss.

Climate change describes notable alterations in worldwide temperature, precipitation, wind patterns, and other climate parameters that transpire over multiple decades or more. Climate change is one of the primary drivers of biodiversity erosion and, in turn, the loss of biodiversity feeds back into climate change processes because degraded ecosystems have a reduced capacity to absorb and retain carbon dioxide (CO₂). The global decline in biodiversity renders ecosystems and landscapes more susceptible to fluctuations in temperature (Shivanna, 160–171). Ecosystems are also becoming less diverse. This endangers the ecosystem processes that these areas naturally provide, such as the freshwater purification of vegetated areas or the pollination of several of our most precious crops by birds, bees, and other wildlife.

Ecosystem susceptibility to newly emerging diseases has been further exacerbated by temperature increases and environmental changes. Projections anticipate that 18% of insects, 16% of plants, and 8% of vertebrate species will lose nearly half of their geographic range if we surpass the '2°C barrier' (McElwee). This two-degree objective, which is a fundamental component of the Paris Climate Agreement, is the international goal for climate policy to keep global warming to less than 2°C relative to pre-industrial levels (1850–1900). In addition to increasing the chance that the world will hit irreversible tipping points, including the collapse of the polar ice sheets and the mass extinction of coral reefs, warming to 2°C exposes a considerably larger portion of the population to extreme and catastrophic weather. With far-reaching effects on ecosystems, rising temperatures have compelled terrestrial plants and animals to relocate to higher latitudes or elevations, with many of them migrating towards the poles (United Nations). With each degree of global warming, in addition to range loss, there is an increased danger of species extinction.

Even though climate change is just one of the many stressors faced by free-ranging

species, it is not the only, isolated threat to biodiversity loss; other environmental hazards can also have an impact on biodiversity. Specifically, pharmaceuticals—such as nonsteroidal anti-inflammatory drugs (NSAIDs; e.g., diclofenac, carprofen, flunixin, phenylbutazone, etc.)—have now been found to impact animal species in the wild (Bean et al., 595–610). Pharmaceuticals are used to identify, treat, prevent, or cure illnesses. However, after use, they reenter the environment. Pharmaceuticals in the environment (PIE) usually arise from a few basic sources: patient usage, as some active pharmaceutical ingredients (APIs) can be excreted from human bodies and into wastewater and, ultimately, natural water bodies; improper disposal of unneeded pharmaceuticals such as being flushed down the toilet; waste from manufacture; and landfill leachate. It has been demonstrated that they can be hazardous to fish and other species by direct toxic effects, changing their behavior in ways that compromise their survival, or interfering with their capacity to reproduce. (EPA, 2024).

Preliminary research suggests that, today, there is a possibility that the harms caused by pharmaceuticals in the environment and on wildlife may be compounded by climate change — an interaction of human-induced environmental threats requiring a holistic assessment. An altered climate linked to an intensified greenhouse effect may impair the storage conditions, use, and health effects of pharmaceuticals, ranging from altered pharmacokinetics (the study of the bodily absorption, distribution, metabolism, and excretion of drugs) to increased medication-induced heat intolerance, among other health effects. It is crucial that we comprehend the potential effects of the interactions between climate change and pharmaceuticals on populations.

In response to this need to comprehensively assess the interaction between climate change and pharmaceutical residue, and the possibility of additive environmental harms, this study sought to determine how these two are linked and what consequences they pose on their environment. To do so, a literature review has been conducted to blend two growing fields of study—climate change and pharmaceutical residue—to provide an enhanced understanding of how they individually, and possibly combined, threaten biodiversity. Given the notable data gap regarding the effects of pharmaceutical residue on terrestrial and aquatic wildlife (Taggart et al., 216-254), information is extended regarding aquatic harms to provide theory for how terrestrial biodiversity may also be harmed. Lastly, this study concludes with suggestions for research, policy, and collective action to combat these harms.

Methods

Search strategy

To identify the essential body of literature present on the relationship between pharmaceuticals and climate change, a literature review has been conducted on literature published between the years 2000 and 2024. Utilizing Google Scholar, Google Chrome, and JSTOR, a search has been done for book sections, peer-reviewed research articles, and educational web pages from government agencies and environmental organizations about how

pharmaceuticals and climate change affect wildlife and the ecosystem. The most pertinent subjects were found when using the keywords: ('pharmaceuticals' OR 'climate change') AND ('impacts' OR 'effects' OR 'risks') AND ('wildlife' OR 'ecosystems' OR 'terrestrial wildlife'). The keywords ('biodiversity loss' OR 'biodiversity') have also been used to identify relevant introductory materials on the topic.

Inclusion/Exclusion criteria

If the material discussed the varied consequences of drugs or climate change on wildlife and the ecosystem, it was considered relevant. Resources were also deemed relevant if there was a link between pharmaceuticals and climate change. Resources were excluded if they discussed only one topic without making any connections with wildlife or had insufficient detail regarding such connections.

Data Analysis

In relevant resources, I made a note of landmark dates, any identified relationship between climate change and pharmaceuticals, and the impact of climate change and pharmaceuticals on wildlife. This information was used to draw comparisons between these two environmental risks and their impacts on wildlife, how they may interact to produce a new environmental effect, and to identify potential remedies that would simultaneously address both. Ultimately, I assessed the degree to which this topic reveals any interpretable trends, compiled empirical data relevant to the research question, developed new frameworks and theories, and identified subjects or questions needing further research.

Literature Review

Definition and Scope of Pharmaceuticals

Pharmaceuticals are compounds used to identify, treat, cure, lessen, or prevent illness or to enhance health, and they include both synthetic and biological agents. They are defined as chemicals that can either stimulate, influence or depress a biological system's physiological functioning, or they can act as a substitute (Finn). The concept of what is conventionally considered a pharmaceutical is expanded by the fact that numerous chemicals, primarily utilized and perceived as pesticides, are also licensed for use in veterinary medicine and as cattle treatments for parasites.

Pharmaceutical Manufacturing and Environmental Impact

Scientific and medical progress were closely linked to the birth of the pharmaceutical business. Mass manufacturing of pharmaceuticals, like strychnine and morphine, is now required due to technological advancements in their research and use (Finn). Numerous kinds of drugs are manufactured, including tablets, capsules, ointments, powders, vials, tablets, solutions, and suspensions. The primary component of the medication that produces the intended result is

known as an active pharmaceutical ingredient. APIs are intricate compounds having a variety of biological, physicochemical, and functional characteristics. They are created and employed due to their rather specialized biological function. Notably, a significant portion of the raw materials needed to produce these prescription pharmaceuticals are produced particularly in China, India, USA and Europe (Kumar et al., 4309–4327).

Drugs are discovered and improved in laboratories during the first stage of drug development. The medicine is then tested in clinical trials to determine its safety and effectiveness in human subjects. Physical procedures used in pharmaceutical manufacture include blending, compression, filtering, heating, encapsulating, shearing, tableting, granulation, coating, and drying. However, in this process, over 300 million tons of plastic trash are produced annually by the pharmaceutical sector, half of which is intended for single-use applications (Kaylor). Due to the COVID-19 outbreak, there has been a significant surge in the amount of pharmaceutical waste generated (Steffi et al., 75-96). Syringes, outdated pharmaceuticals, and waste products containing medication residues are examples of pharmaceutical waste. In total, the progress and expansion of the pharmaceutical industry has, in parallel, contributed to environmental degradation — begging questions about how such impacts may compound with climate change.

Climate change overview

Climate change is referred to as long-term changes in the average weather patterns that characterize local, regional, and global climates on Earth; it has a wide range of observed consequences (NASA). Human activity, especially the burning of fossil fuels (which releases large amounts of CO₂, a greenhouse gas, into the air), has increased the amounts of heat-trapping greenhouse gasses in the atmosphere, which has raised the average surface temperature of the planet since the middle of the 20th century. Similar to the glass of a greenhouse, certain gasses in the Earth's atmosphere retain solar radiation, preventing it from escaping back into space and causing global warming. Pharmaceutical manufacturing requires extremely high levels of energy since it must maintain temperature, humidity, pressurized rooms, cleanliness, and containment to produce its products. Natural mechanisms such as internal variability (which refers to effects of oceans, continental drift, atmospheric processes, ice and snow, volcanic eruptions) and external change (including human-made ones that expedite climate change), overwhelmed by human activity can also play a role in climate change. Climate data records offer proof of major signs of climate change, including increases in global land and ocean temperatures; rising sea levels; melting of ice in mountain glaciers and at Earth's poles; variations in the frequency; and intensity of extreme weather events like hurricanes, heatwaves, wildfires, droughts, floods, and precipitation, and shifts in cloud and vegetation cover (NASA).

The Impacts of Climate Change on Wildlife

It is estimated that about 11,000 species have been affected by climate change, to date (IFAW). Research has described numerous effects of climate change on wildlife and natural

terrestrial habitats. The rate of global sea level rise is accelerating; for over 100 years, sea levels have risen by over 22 cm and the increasing sea surface temperatures will cause this number to rise even further (Lindsey). As a result of the warming climate, snow and glacial ice sheets on land will melt, increasing the amount of water in the ocean. Due to sea level rise, habitat loss will occur from inundating inland coastal environments. This has immediate impacts on wildlife species (e.g., walruses, polar bears, turtles and seals) that inhabit beaches, sand dunes, and estuaries. Because they live in both terrestrial and marine habitats and at the interface of the atmosphere and the ocean, seabirds may be the most susceptible bird species to the effects of climate change, particularly sea level rise; and according to predictions, a 0.9 m rise in sea level would swamp up to 40% of low-profile green turtle (*Chelonia mydas*) breeding sites (Holle et al., 694-704). Moreover, habitat fragmentation—the division of a habitat into smaller, more isolated pieces—can result from habitat loss.

Habitat fragmentation and loss can make it more challenging for wildlife to obtain adequate resources for survival (e.g., food, partners, and shelter) in addition to increasing their vulnerability to predators and other dangers (National Wildlife Federation). Genetic isolation brought on by habitat fragmentation might lower genetic diversity and possibly raise the incidence of inbreeding depression (Pavlova et al., 531–550), which is the decreased fertility of kin's progeny and may lower a population's ability to survive and reproduce. The loss of habitat may also have further, broader effects on ecosystems, such as altering nutrient cycles. For example, the removal of plants and trees which stabilize soil promotes erosion and lowers the amount of nutrients in terrestrial ecosystems. Consequently, when erosion rises, pollution and debris accumulate in rivers and streams, lowering the quality of the water. (Understanding Global Change)

Specific Case Studies

Deforestation, commonly attributed to direct human activities, is a specific type of habitat loss that is also now being driven by consequences of climate change. Deforestation is exacerbated by an increase in wildfires, insect outbreaks, alien species, and the frequency of extreme weather events like storms (Seymour & Gibbs). Changes in climate are creating warmer, drier conditions, increasing drought. Wildfire risk is rising because of an extended fire season. Increased temperatures may facilitate the spread of invasive species into previously unsuitable cold-climate habitats, affecting the native inhabitants. Increased evaporation of moisture due to rising temperatures worsens intense rainfall and flooding, leading to occurrences of devastating storms which cycles back to the loss of habitat. Current estimates indicate that deforestation is responsible for the extinction of 137 species of plants, animals, and insects worldwide per day. This equates to a startling 50,000 species facing extinction from deforestation every year (Rainforest Facts).

In addition to threatening wildlife habitats, climate change can also directly impact the bodily health and function of animals. An Austin, Texas, team discovered that when temperatures rise and permafrost (soil that has been frozen for thousands of years) melts and is broken down by fungi and bacteria, animals start consuming more "brown" or detrital sources of food such as dead animal skin and fecal pellets, which come from the microbial breakdown of

permafrost and plant material, rather than as many "green" sources of energy, which come from plants. (Staff Writer).

Mycotoxicooses are illnesses brought on by consuming 'brown' resources that contain fungal toxins. Researchers identified changes in eating habits in both wolf spiders from the Arctic tundra that had been experimentally warmed and small mammals in boreal forests (data from 1990-2021). Exposure to feed contaminated with toxins generated by certain fungus or molds resulted in poisoning of wildlife (Ahmed et al.).

Phenological Changes

Phenological changes are one effect of climate change on species' physical and chemical attributes. Phenology is "the study of cyclic and seasonal natural phenomena, especially in relation to climate and plant and animal life" (Oxford dictionary). Wildlife have recently undergone notable phenological modifications including shifts in the dates and times of migratory birds' arrivals and departures, as well as the start of mating seasons and singing period. Wildlife can also alter the habitat they occupy, or how much they use their prime habitat, in response to changes in their preferred vegetation for food or shelter. Wild species will therefore follow changing climatic conditions along with their preferred vegetation community and, within the bounds of their dispersal capacity and resource, will alter their range. Species migrate to higher latitudes in quest of their preferred climate regimes when temperature changes along latitudes because their initial habitats become too warm for them (Couet et al., 877-888). A multitude of environmental cues, including variations in temperature, destroyed or fragmented habitats, duration of day, and availability of food, propel the intricate and highly coordinated process of migration. Many species are finding it difficult to adapt and adjust to the new environment as climate change is changing these cues, and as a result, their populations are decreasing.

Sources of Pharmaceutical Contamination

Expanding human populations, rising living standards, and an increased dependence on healthcare are raising concerns over pharmaceutical contamination of the environment. The pharmaceutical market is expanding at a compound annual growth rate (CAGR) of 6.15% from 2024 to 2033 (BioSpace). Increased pharmaceutical production generates more waste materials that are released into the environment in numerous ways. Some of these include human excretions from individuals that have consumed pharmaceuticals, factories disposing expired or unused pharmaceuticals improperly, and sewage leaks from impaired treatment plants. Across multiple environmental matrices, such as soil, groundwater, and surface water, pharmaceuticals constitute an emerging pollutant (Samal et al.). Aquatic ecosystems are a geochemical hotspot for pharmaceutical residue. This is where the majority of pharmaceutical residue is known to be identified, particularly due to runoff into wastewater (Heberer, 5-17).

To date, research on the impact of pharmaceuticals on wildlife have primarily been driven by studies on aquatic systems. For example, studies on frogs and fish have shown that even slight concentrations of pharmaceutical residue have caused endocrine disruption and behavioral

changes. Fish experience hormonal imbalances that lead to developmental issues when exposed to even modest doses of antidepressants (e.g., Prozac, Zoloft, Paxil, Celexa), while frogs experience delays in metamorphosis. Male and female mosquitofish exhibited delays in reaching sexual maturity and reduced fertility, with some males showing sexual developmental delays of up to four weeks (Walton). More broadly across aquatic systems, these animals can be consumed by higher trophic levels which can subsequently contribute to bioaccumulation of these pharmaceutical effects through trophic cascades. Ultimately, these studies have demonstrated that pharmaceuticals can delay the formation of reproductive organs, which can impede reproduction, induce movement impairments and ultimately result in mortality (Néstor & Mariana, 235-253).

Effects on Terrestrial Wildlife

Despite the progress made to chronicle pharmaceutical impacts on aquatic systems, it is critical to expand this scope onto terrestrial systems as well. Whereas aquatic wildlife are typically exposed to pharmaceuticals directly in their environment, terrestrial wildlife are more commonly exposed via contaminants that leach into their surrounding soil, water, and food resources. Pathways for terrestrial contamination include water that filters through a landfill and produces leachate, using contaminated sewage and manure as fertilizers on land—which may also cause runoff from agricultural lands, and to some animals via drinking contaminated water. Fungal infections, such as Fungal Meningitis caused by *Exserohilum rostratum* contamination, have also been reported via contaminating pharmaceuticals (Ahmed et al.). This illustrates the long-lasting effects of pharmaceuticals and drugs, which continue to persist even when diluted. Comparable to the impacts on aquatic fauna, terrestrial species also encounter disturbances in their endocrine systems. For instance, one research study found that cattle that consumed chicken excrement, which contained both estrogen and testosterone residue, had hormonal dysregulation. Additional studies have shown that vultures and kites can experience negative impacts on their immunocompetence, egg development, and illness prevalence due to pharmaceutical residue as well (Shore et al.).

Ecosystem Level Impacts

At an ecosystem level, wildlife is most commonly exposed to, and impacted by, pharmaceuticals via bioaccumulation from eating or scavenging contaminated carcasses as well as consuming contaminated water, such as from lakes or rivers. In one poignant example, pharmaceutical intoxication and death in animals have been linked to barbiturates, particularly those employed as euthanizing agents. Domestic animals that have been euthanized, typically with pentobarbital, must be properly disposed (e.g., burial, incarceration) or else scavengers will be exposed to barbiturates. These cases have been found to primarily affect avian scavengers (e.g., bald eagles, griffon vultures) in North America and Europe, with a documented exposure of mammalian scavengers in Spain in 2021 (Bean et al., 595–610).

Discussion

Possible Interactions between Climate Change and Pharmaceutical Residue

Although the environmental ramifications of climate change and pharmaceutical residue have been studied separately, questions linger about whether their combined effect could be more potent on human and animal life. Though there is a paucity in the research on how and to what extent climate change alters pharmaceutical composition and potency, evaluation of current research yields some insight.

It is well known that climate change contributes to warming and rising oceans, as well as intense rainfall and greater floods. During this time, various compounds—pharmaceuticals included—can dissolve in water and soil, ultimately contaminating food resources and significantly risking poor health amongst humans and wildlife alike in most ecosystems. As a compounding effect, climate change is contributing to habitat loss, which may impact wildlife to seek suboptimal food resources (e.g., dangerous or diseased resources (Redshaw et al., 285–320).

Research has found that warming temperatures have been shown to cause shifts in animals' eating patterns, leading them to consume tainted food sources; from this, it is plausible that animals may also be contaminated by pharmaceuticals. The extent of this food contamination will likely increase with climate change; for example, agricultural runoff is anticipated to increase and as a result, pharmaceutical residue is also expected to spread more quickly.

In addition, climate change may reduce the efficacy of medication at temperatures above or below the drug's recommended range. Elevated temperatures quicken the processes that lead to the oxidation and hydrolysis of pharmaceuticals, hence reducing their medicinal value and producing harmful byproducts. For example, hydrazine, which has demonstrated considerable genotoxicity and carcinogenicity in animal experiments, is formed when isoniazid hydrolyzes at high temperatures (Khuluza et al.). Climate variables like humidity and temperature directly affect how stable pharmaceutical items are and can cause them to degrade before they expire (Wotring, 210–216). Though not all classes of pharmaceuticals may be affected, most tend to be. Compared to temperate ones, tropical ectotherms are most vulnerable to the effects of global warming (Johansson et al., 8822) and hence, changes in the effects of pharmaceuticals, given that their low latitudes put them far closer to their physiological optimum than do temperate taxa.

Research assessing insulin potency found that it was impacted by incorrect temperature storage settings. Insulin potency decreased by 14–18% when held at higher than recommended temperatures (32 and 37°C, as opposed to the ideal 5°C). As such, there was no discernible drop in blood sugar levels, when there should have been, in rabbits (Vimalavathini & Gitanjali, 166–169). Based on this study, it is realistic to infer that the effect of additional drugs—including in the form of pharmaceutical waste—can be altered and become more harmful to wildlife, too. Similarly, increasing soil temperatures can alter the composition of pharmaceuticals already present in the soil, perhaps due to agricultural runoff, by making them inactive, changing the effects and their intensity on animals that consume them.

Additionally, the demand for and production of pharmaceuticals will rise in tandem with the number of ailments brought on by climate change. Greater pharmaceutical production, without any change in its disposal, will inherently risk an increase in its subsequent waste and residue in the environment. Furthermore, pharmaceuticals require energy for their manufacture, distribution, and preservation; when this energy is derived from fossil fuels, the pharmaceutical industry will directly contribute to climate change. It is currently estimated that the pharmaceutical sector emits 52 megatons of carbon dioxide yearly (Smith), a staggering amount that is comparable to the emissions from 11 million cars. On top of this, additional energy may be required to store pharmaceuticals at their required temperatures. Thus, the challenge to meet and maintain these storage temperatures may increase with climate change. Increasing energy consumption to store pharmaceuticals complicates climate change and has a negative feedback loop on the environment.

Ultimately, although people are living longer and with enhanced quality of life, in part due to pharmaceutical progress, research has only begun to uncover the extent to which these products can harm the environment and subsequent organisms within it. Nevertheless, burgeoning research has already demonstrated that these threats are palpable. As such, it is critical that governments enforce more stringent laws on the disposal methods of unwanted pharmaceuticals to restrict the widespread flushing of pharmaceuticals in hospitals, assisted living facilities, and other healthcare settings, to reduce the quantity that enters the natural environment uncontrolled; indeed, this may be the most effective solution in mitigating the issue. Drug take-back initiatives should include funding for public lectures on safe drug disposal practices and restricting large purchases in bulk will guarantee that only the necessary quantity is provided. More developed wastewater treatment processes will also address the problem, as they will ensure that organic compounds and suspended particles are removed from the water. Moreover, further investigation is sorely needed to evaluate the possible human origins and consequences of pharmacological contamination on terrestrial wildlife.

Conclusion

Currently, limited studies exist regarding the effects of climate change on pharmaceuticals as well as their further ramifications on wildlife. Whereas climate change is contributing to habitat loss, disease spread, genetic isolation, and phenological changes for wildlife, pharmaceuticals can pollute the environment and subsequently cause imbalances in animal bodily functions. Increases in heat due to climate change have been shown to affect the composition of pharmaceutical products, altering the drug's use or degree of power. Higher temperatures may increase the need to use medications to reduce any illnesses caused by these changes which further increases the demand and production of pharmaceuticals. Enforcing stricter laws and regulations on the amount of greenhouse gasses that factories should be allowed to produce, disposal methods of pharmaceuticals and testing their harms further on wildlife is essential if we are to seriously, and holistically, mitigate the rate at which animals are being endangered and going extinct. High fines, to ensure that the mitigation works, will motivate

citizens to follow the rules even if they may not be actively trying to conserve nature.

Innovative Methods for the Detection of Parkinson's Disease By Tanvi Bhalla

Abstract

Parkinson's Disease has had a significant impact on patients with the disease, and there have been recent advancements in early detection methods. These modalities include using EEG measures, gait measures, and acoustic measures. EEG measures are capable of identifying abnormalities in subcortico-cortical circuits in Parkinson's Disease patients. Acoustic measures can identify vocal irregularities, such as increased variations in fundamental frequency (jitter measure) and amplitude (shimmer measure) in the voices of Parkinson's Disease patients. Gait measures indicate that slow gait speed and increased cadence may serve as indicators of Parkinson's Disease. These three modalities were selected due to their simplicity and accessibility, in contrast to more costly and less accessible modalities like fMRIs and MRIs. This review examines the current knowledge in each of these areas and explores their potential for early detection and assessment of the severity of Parkinson's Disease. The review also covers machine learning applications with each modality and the advantages and limitations of each method. Multiple studies are provided for each modality, and the different parameters they measure are explored as well.

Introduction

Parkinson's Disease (PD) is a progressive disorder of the central nervous system characterized by a significant decrease in dopamine levels due to damage to nerve cells, resulting in various symptoms including tremors, stiffness, vocal abnormalities, and postural instability. Early diagnosis of PD is crucial for understanding and effectively managing the condition to enhance patients' quality of life. Timely identification of the disease can facilitate the discovery of treatments to slow its progression, thereby providing a therapeutic window to mitigate its impact. While traditional diagnostic methods rely on clinical and neurological assessments and are effective in detecting PD at more advanced stages, three modalities, in particular, have emerged as promising tools for identifying the disease at its earliest stages and are gaining increasing recognition in the field. These three modalities are acoustic measures, gait measures, and electroencephalography (EEG) measures.

Identifying PD in its early stages poses a significant challenge in the field of neurotechnology, and these three modalities offer distinct methods to address this challenge. Acoustic measures involve the analysis of voice recordings to extract specific measures, including fundamental frequency (the rate at which vocal folds vibrate when making voiced speech sounds) and amplitude (the strength of the vibrations transmitted in a voice). These measures provide valuable insights into the voice variations present in PD patients, such as increased breathiness or altered pitch. Utilizing acoustic measures is particularly effective for early-stage PD analysis, as it allows for the detection of subtle voice differences that might otherwise go unnoticed. This approach significantly accelerates the identification of PD, detecting even the slightest variations before other clinical symptoms manifest.

Gait analysis involves assessing the movement patterns of individuals to detect PD. Common PD symptoms, such as tremors, manifest in these movement patterns, resulting in asymmetric and hesitant movements as individuals attempt to compensate for the tremors. Gait analysis has the potential to detect Parkinson's disease in its early stages by identifying subtle alterations in movement patterns, even before noticeable tremors develop. Therefore, sudden changes in gait patterns could serve as an early indicator of the disease, even in the absence of other typical symptoms.

EEGs are utilized to assess brain functioning to diagnose PD. The identification of PD involves the assessment of reduced low-frequency brain waves within the frontal brain region, as well as the monitoring of specific wavelengths and determining reduced band activity, which is then correlated with PD-related decline. PD is characterized by excessive beta band activity in the motor cortex and basal ganglia, leading to the bradykinesia observed in PD patients. Additionally, EEG analysis encompasses the examination of cortical connectivity and synchronization, both of which are typically disrupted in PD. Abnormal thalamocortical dysrhythmia, indicating the presence of PD, can be rapidly identified through EEGs by detecting abnormal coherence and phase relationships between brain regions. Furthermore, EEGs provide evidence of reduced connectivity between the motor cortex and other brain regions in PD patients, aligning with the motor symptoms observed in EEG assessments. These are all examples of the types of EEG measurements that can be used to identify PD. Overall, EEGs have established themselves as a precise diagnostic tool for early-stage PD, offering valuable insights into specific abnormal brain regions long before the emergence of overt disease symptoms, thereby enabling the early detection of PD through distinct brain wave patterns.

Acoustic, gait, and EEG measures demonstrate efficacy in detecting Parkinson's disease by directly addressing the motor, neurological, and vocal disturbances, which serve as indicators of the condition. Furthermore, all three methods are non-invasive and cost-effective (i.e., they do not necessitate the use of elaborate or expensive equipment). These diagnostic tools can be employed in a clinical environment or remotely, thereby offering a practical means for early detection. The utilization of these methods crucially also facilitates the assessment of disease progression. Gait measures can help identify increased abnormal movement patterns to gauge the extent of disease advancement, while EEG measures can determine the rate of reduction in band activity to infer whether disease progression is decelerating. Moreover, EEGs are a more practical alternative to advanced imaging techniques like fMRI and MRI, which may provide detailed brain images but are less effective in capturing real-time dynamics for disease monitoring. Acoustic measures have the capacity to identify heightened pitchiness or breathiness in speech, indicating disease progression, and can be conveniently administered and repeated due to minimal data collection efforts. Additionally, acoustic measures offer a novel approach to disease analysis, focusing not on functional changes in the brain but on how these changes influence speech and establish a link between cognitive decline and motor manifestations in the voice, similar to gait measures. These three modalities excel in Parkinson's disease detection by providing real-time insights and employing a multifaceted approach to disease study, thus

proving to be more cost-effective than alternative methods. Their usability outside of clinical settings further accentuates their time-saving potential for researchers, medical professionals, and patients. This review paper thoroughly explicates the characteristics of each modality and their respective outcomes.

Acoustic Measures

Acoustic measures play a crucial role in the identification of PD by allowing for the analysis of an individual's voice for potential indicators of dysphonia (impairment in the ability to speak). Tremors, a key symptom of PD, can manifest in the voice as shaky, breathy, or pitchy characteristics. One commonly used tool for this analysis is the multi-dimensional voice program (MDVP), which calculates up to 33 vocal parameters. Essential measures utilized in voice analysis include jitter (which assesses fundamental frequency variation), shimmer (assessing amplitude variation), Noise-to-Harmonics ratio (NHR), detrended fluctuation analysis (DFA) for signal variation, and period pitch entropy (PPE) for nonlinear assessment of fundamental frequency variation. Individuals with PD demonstrate higher jitter measures compared to healthy controls, indicative of reduced voice stability. Furthermore, PD patients exhibited elevated shimmer measures, reflecting increased variability in voice loudness, hoarseness, and breathiness. Meanwhile, NHR measures tend to be higher, and HNR measures are lower, denoting diminished tonal quality in PD patients' voices.

Little et al. (2008) conducted a noteworthy study to support the findings discussed above. This study demonstrates the diverse ways in which vocal measures impact the voices of individuals with PD. Ranging from irregular pitch to heightened hoarseness, PD patients' voices manifest more irregularities than those of healthy individuals. This highlights the potential of acoustic measures in identifying early-stage PD, given that recording a voice is non-invasive and could serve as a potential biomarker. The pronounced disparity in measures is evident, with jitter levels ranging from 1.2% to 1.5% in PD patients, as opposed to below 1% in healthy controls (Little et al., 2008). Notably, the study achieved an accuracy of 91.4%, underscoring the efficacy of acoustic measures in Parkinson's classification (Little et al., 2008). The combination of the various acoustic measures in this experiment is designed to provide comprehensive insights. For instance, greater jitter correlates with increased shimmer, and higher abnormalities in both aspects are associated with heightened voice irregularities, aligning with PD symptoms. Findings indicate noticeable variations in the mean fundamental frequency (f_0), max f_0 , min f_0 , jitter, and median intensity of speech between PD patients and healthy controls. Specifically, PD patients exhibit a lower start f_0 , lower max f_0 , higher mid f_0 , and higher-end f_0 . This suggests a reduction in vocal fold frequency vibrations among PD patients, likely due to reflexive laryngeal muscle contraction in PD. Additionally, PD patients display quicker speech patterns and shorter duration in reading the same sentence as healthy controls, attributed to muscle stiffness arising from dopamine depletion in the basal ganglia, affecting the controllability of laryngeal muscles which, in turn, impacts rhythm and timing. Reduced airflow from the lungs to the vocal cords resulted in breathy and occasionally hoarse voices in PD patients. Moreover, PD patients exhibit

lower HNR, higher jitter values, and fundamental frequency, indicating stiff vocal folds due to laryngeal musculature firmness.

A study by Yang et al. (2020) provided additional evidence to support these findings. The severity of the disease was best measured by the slope of maximum pronunciation to the ending of a phrase, median intensity, and duration, all showing significant differences between PD patients and the control group. Furthermore, PD patients demonstrated higher median intensity in vocalization, and PD patients with the highest values of median intensity had the disease in its most advanced stages, potentially indicating increased disease severity (Yang et al, 2020). The findings showcase the abnormal changes in the voices of PD patients, suggesting the potential use of specific vocal measures in identifying PD. The research emphasizes the importance of these vocal parameters in distinguishing between healthy controls and PD patients, making PD easier to identify.

The presence of dysphonia in patients adversely affects their quality of life, with subsequent implications for their mental well-being. By utilizing acoustic measures to promptly detect PD, efforts can be made to mitigate the progression of dysphonia in patients, thereby preserving their quality of life. This trend of PD patients exhibiting more voice irregularities is consistent with previous findings and is reported to have a negative impact on the patient's perception of self and lower scores on the Beck Depression Inventory (Silva et al., 2012). A study by Silva et al. (2012) uses 27 male voice recordings to showcase how having dysphonia negatively affects the outlook on life. These findings showcase the importance of acoustic measures in early PD detection, as the fundamental frequency and jitter measures served as objective indicators of the PD group's more erratic voice, attributed to the tremors associated with PD. Early identification of PD could also facilitate interventions such as voice therapy for patients, thereby alleviating stress.

Machine learning, in combination with acoustic measures, may offer a further understanding of PD. Employing machine learning models to enhance acoustic analysis, by training the models to accurately identify PD based on data, could streamline the research process significantly. A study conducted by Bang et al. (2013) analyzed seven female PD patients and seven female healthy individuals. The participants were asked to vocalize extended corner vowels thrice for five seconds at a comfortable voice level. Praat, which stands for Phonetic and Acoustic Analysis Toolkit Program, was employed for annotating the acoustic speech signals. Through the input of voice samples into Praat, distinctions between healthy and PD groups were discerned, facilitating the clear identification of the disease-afflicted group. Utilizing the Praat program, the results indicated that female PD patients exhibited increased jitter and NHR. The F1 and F2 measures in PD patients revealed asymmetric centralization of unrounded vowels in positions of the tongue, signifying reduced vowel space areas (Bang et al., 2013). F1 measures are related to vowel height, where a higher F1 measure indicates a lower vowel. F2 measures are related to vowel backness, where a higher F2 measure indicates a more frontal vowel. This asymmetrical centralization of the tongue, affecting voice tone and loudness, is characteristic of hypokinetic dysarthria, a condition involving deficits in respiration,

phonation, articulation, and prosody. Notably, the study findings support previous research, particularly in relation to jitter, shimmer, and NHR. Moreover, the utilization of the Praat program for data analysis emerged as a key focus of this study. Little et al. (2008), previously cited, also utilized the Praat program for traditional acoustic measures, highlighting the potential of integrating software programs to expedite the analysis of acoustic measures. This approach optimizes the model's ability to swiftly identify PD, enhancing the prospects of acoustic measures serving as a biomarker for the disease. While pharmacological and neurosurgical approaches have not extensively utilized voice characteristics for diagnosing Parkinson's, features such as jitter, shimmer, and NHR could serve as objective variables for assessing speech disorders associated with PD.

Gait Measures

Gait measures constitute a vital method employed for the analysis of movement patterns between two distinct points. In the context of PD, these measures offer insights into the impact of the condition on an individual's walking ability. Gait measures assume a significant role in the identification of PD, as they detect bradykinesia, reduced arm swing, postural instability, and shuffling steps, all of which are key indicators of the disease. Bradykinesia is a PD symptom that impairs motor control and can cause slow movements or freezing. Deviations of a patient's values from those of healthy controls are indicative of an elevated likelihood of PD, with increasingly abnormal values suggesting advancement to more severe stages of the disease. Furthermore, gait measures can serve as potential biomarkers for early-stage PD, given that abnormal walking patterns represent symptomatic manifestations. Consequently, the progression of the disease can be tracked by the increasing prominence of alterations in walking patterns, characterized by slower and stiffer movements due to muscular involvement and a reduction in stride length.

The line of progression, a crucial gait measurement parameter, outlines the central trajectory between the left and right footprints. Under normal circumstances, the right foot remains to the right of the line of progression, while the left foot stays to the left. In PD, both feet may become aligned exactly along the mid-line or exhibit slight asymmetry. In addition to gait velocity, another crucial measurement is cadence, defined as the number of steps taken per minute. While the average cadence ranges from 80 to 90 steps per minute, individuals with PD exhibit reduced step count. This gait pattern is characterized by rigidity, decreased movement speed (bradykinesia), diminished stride length, and irregular accelerations during walking. Gait analysis is closely linked to PD due to the impact of motor symptoms on walking patterns. Bradykinesia, for instance, leads to reductions in gait speed and step length, while tremors and muscle rigidity further exacerbate gait irregularities, particularly affecting parameters like cadence and stride time.

When examining gait, wearable sensor systems stand out as the most widely utilized method of analysis. These systems provide objective measurements of gait parameters, allowing for a clear differentiation between healthy individuals and those with PD. For instance, common

PD symptoms such as increased stride time and reduced step length can be effectively monitored and quantified through the use of wearable sensors. These sensors capture the relevant data, which, when stored, can be leveraged to analyze PD symptoms, offering valuable insights into the impact of PD on muscles, particularly in the context of walking.

Brognara et al. (2019) conducted research utilizing wearable sensor systems for gait analysis, focusing on spatio-temporal parameters. The use of inertial sensors for diagnostic purposes in a clinical setting was a primary area of examination (Brognara et al., 2019). A review of 36 articles highlighted the most prevalent parameters for spatiotemporal gait analysis, including gait speed (present in 90% of the articles), cadence (61%), stride length (52.8%), stride time (41.7%), and step time (27.8%) (Brognara et al., 2019). Although parameters such as step length, right-left asymmetry, double support, stance, and swing time were also considered, they were not as commonly observed. The review underscored the potential of gait analysis with wearable sensors in the identification of PD, as the values observed in PD patients markedly differed from those of healthy individuals.

Importantly, additional studies also revealed that gait parameters were susceptible to changes and mirrored the progressive nature of Parkinson's Disease, as captured by the wearable sensor system. Schlachetzki et al. (2017), utilized wearable sensors positioned laterally on both shoes, to study 190 PD patients and 101 healthy controls. Reduced foot clearance, indicative of shuffling, was particularly evident, with controls exhibiting an average foot clearance of around 14.3 centimeters, while PD patients had significantly reduced foot clearance at an average of 10.6 centimeters. Reduced foot clearance may elevate the risk of tripping as it relates to the foot's height during the swing phase. Furthermore, PD patients exhibited a 21.5% reduction in the heel-strike angle, a 7% reduction in normalized stride length, a 5% increase in stride time, and decreased cadence and gait velocity, highlighting a slower walking pattern (Schlachetzki et al., 2017). These findings underscore how gait analysis, with its quantitative values, can serve as an objective method to diagnose Parkinson's Disease and track its progression. The study also emphasizes the pivotal role of wearable sensors in gait measurement for PD, as these sensors serve as the primary data collection component for subsequent analysis.

The comparison of gait values between PD patients and healthy controls reveals significant differences. Utilizing gait data as a biomarker for PD proves to be particularly beneficial due to these differences. Objective quantitative gait parameters exhibit notable variances from normal values as the disease progresses through its stages. Identifying the stage of PD in a patient could serve as a valuable tool in evaluating treatment approaches, and employing gait parameters for this purpose could reduce the risk of inaccuracies. Analysis of these parameters can also provide insight into the level of muscle rigidity in PD patients. Findings that individuals in the more advanced stages of PD exhibited slower walking speed and shorter, shuffling steps compared to those in the early stages. Moreover, these advanced-stage patients displayed a wider base of support while walking, presumably to compensate for postural instability (Hass, Malczak, Nocera, Stegemöller, Shukala, Malaty, et al., 2012). Their average walking speed of 0.88 m/s was notably slower than that of the healthy older population, whose

average values ranged from 1.06 m/s to 1.22 m/s. Research reveals that severely affected patients walked at an average speed of 24% slower than those with milder symptoms (Hass, Malczak, Nocera, Stegemöller, Shukala, Malaty, et al., 2012). While gait speed is a widely recognized parameter, other gait parameters also hold the potential for predicting fall risk and mobile stability in PD patients. For example, the swing phase in a walking cycle typically constitutes 40% of the cycle. However, severely affected female PD patients displayed a swing phase of only 30%, substantially increasing their risk of falling and indicating the presence of smaller, shuffling steps. These findings come from research conducted by Hass, Malczak, Nocera, Stegemöller, Shukala, Malaty, et al. (2012), who used 310 individuals with idiopathic Parkinson's Disease.

The marked differences between the values for the two groups, particularly in parameters such as the swing phase, emphasize the reliability of gait parameters as a diagnostic tool. Walking speed, stride length, swing time, and hip excursion tend to be diminished in patients with PD. Conversely, the cadence and double support time exhibit an increase in PD patients compared to their healthy counterparts (Zanardi, da Silva, Costa, et al., 2021). Furthermore, PD patients demonstrate slower walking speeds and smaller steps in comparison to matched healthy controls, underscoring the marked differences in gait between the two groups. Research by Zanardi, da Silva, Costa, et al. (2021) reiterates the conclusions drawn from previous studies, highlighting the significant anomalies in gait parameters in PD patients as compared to healthy controls. This reaffirms the pivotal role of gait as a distinguishing identifier of PD, as the discrepancies in gait metrics delineate the symptoms of PD.

EEG Measures

EEGs are a medical procedure involving the application of electrodes to the scalp to record the brain's electrical activity. This diagnostic tool is precious in the identification of PD as it directly captures brain activity. EEG readings involve the analysis of postsynaptic potential, which is derived from the interactions of thousands of neurons, reflecting various brain wave patterns. The signals obtained from EEG procedures are amplified, digitized, and subsequently transmitted to an electronic device for storage and data analysis. Moreover, the main frequency bands analyzed encompass delta (0.5 - 4 Hz), theta (4 - 8 Hz), alpha (8 - 12 Hz), and beta (16 - 30 Hz) waves. Notably, individuals with PD exhibit distinguishable angles and sharpness in their brain waves compared to those of healthy counterparts. Consequently, EEGs can unveil abnormalities in dopaminergic subcortico-cortical circuits within PD patients. This can importantly serve as an indicator of disease severity and aid in pinpointing the primary brain regions affected, along with potential side effects.

EEG data, specifically the analysis of signals from the frontal regions of the brain, is highly valuable for identifying abnormalities in brain activity. The higher density of cortical neurons in the frontal region allows for more detailed readings, making it particularly useful in the study of PD. Reading data from these frontal regions shows how EEG can be a useful biomarker for PD. In a study conducted by Sahota et al. (2023), PD was characterized from EEG

data as a "15-variate series of band power and peak frequency values/coefficients," (Sahota et al., 2023). Band power refers to specific ranges within the power spectral density, while peak frequency indicates the frequency coefficients that peak in power spectral density. The study involved recording participants in a wakefulness state, as well as in all four stages of the sleep cycle (N1, N2, N3, REM). Upon collecting data from both healthy individuals and PD patients, the researchers compared the length in epochs of all five stages from PD patients and the controls (Sahota et al., 2023). They then computed the band power and peak frequency values and, using a trained classifier, they tried to predict the accuracy of the predictions made. The results indicated that the classifier trained on the Right Temporal region achieved 85% accuracy, while the Left Frontal region achieved 78% accuracy. In contrast, the baseline models performed less accurately, with the highest accuracy reaching only 73% (Sahota et al., 2023). These findings can be attributed to the significant involvement of the frontal regions in motor control and executive functions, as well as their extensive cortical folding, which results in stronger electrical signals detectable on the scalp. Notably, the classifier accuracy revealed that the N1 data type was significantly better in recall than the other sleep stages. N1 data represents the lightest sleep stage and is shown to be the most significant data type. This suggests that it can potentially indicate restlessness in patients with early-stage Parkinson's, as they may struggle to fall asleep as quickly as before. The study underscores the clear potential of EEG data as a biomarker for PD, given its ability to analyze brain activity and detect abnormalities in comparison to healthy controls. Furthermore, the relatively small sample size of 19 healthy controls and 11 PD patients in this study highlights the need for future research with larger sample sizes to further establish the efficacy of EEGs as a biomarker, particularly in the context of monitoring brain activity during sleep cycles. The small sample size could affect the accuracy of the experiment.

Quantitative electroencephalography (qEEG) represents an important modality for assessing cognitive decline in PD. By leveraging purely quantitative and objective values, qEEG analysis offers insight into cognitive impairment in PD patients. The uniformity and objectivity of qEEG measures present the potential for early and accurate recognition of PD-related cognitive decline. Given that certain quantitative values serve as clear indicators of PD, early identification of these values could position qEEG as a potential biomarker. QEEGs can be used to identify cognitive decline in PD. QEEG processes EEG data mathematically to see relevant information. Conventionally, EEG data is qualitatively analyzed, but qEEG has parameters. Several steps are required, such as collecting the EEG data, preprocessing (removing EEG noise), and mathematically processing the "clean" EEG data. Linear and nonlinear processing techniques are used, where linear techniques use EEG data as a stationary process, and nonlinear uses EEG data as an irregular occurrence (Cozac et al., 2016). An example of linear processing is spectral analysis, which is decomposing EEG signals into component frequencies and calculating the oscillation amplitude at each frequency (Cozac et al., 2016). Studies usually focus on spectral features of cognitive states in PD and use them to identify the difference between Parkinson's Disease with normal cognition (PD-NC) and Parkinson's Disease with dementia (PD-D). Global delta and theta powers (increased in PD-D patients) and peak background frequency (decreased

in PD-D patients) were most useful in differentiating between PD-NC patients and PD-D patients. Focusing on functional connectivity features of cognitive states in PD was another use of qEEG, where PD-D patients had higher global field synchronization in theta frequency range and lower global field synchronization in the alpha 1 range. Cozac et al. (2016) showed how qEEGs can be used to analyze spectral and connectivity markers in PD patients to differentiate the levels of cognitive decline in them and find if they have dementia or not. Slower EEG frequencies are indicative of a decline in cognition, characterized by increases in the "slow" frequency bands (delta and theta), while the "fast" frequency bands (alpha and beta) show a decrease, which serves as an additional marker of cognitive decline (Shirahige et al., 2020). Connectivity measures reveal alterations in the frequency ranges of theta, alpha, and beta. There is a discernible decrease in connectivity patterns within the parietal-temporal-occipital regions of the brain, which corresponds to cognitive decline. The data is objective and identifies specific values that indicate PPD, notably the deceleration of "fast" frequency bands. This underscores the potential of EEG data, particularly qEEG data, as a valuable standardized biomarker. Motor symptoms in PD patients suggest a deceleration of cortical activity during both resting and complex movement action states, in contrast to healthy controls (Shirahige et al., 2020). Additionally, a lower dominant frequency and heightened theta power are observed in PD patients. Shirahige et al. (2020) supported the previous findings.

Although there are limitations such as a non-reduced sample size and a high risk of bias, the findings of the study suggest a deceleration of cortical activity during movement. Nonetheless, a larger controlled trial is necessary for this study, specifically incorporating a blinded qEEG analysis to prevent biases. These two qEEG studies present an alternative approach for evaluating the severity and potential diagnosis of PD. By examining band waves during resting and movement states, identifying PD patients with decreasing "fast" band waves and increasing "slow" band waves may serve as a potential biomarker for the disease. The deceleration of cortical activity could be a reliable indicator of the presence of PD, and identifying spectral features could also help identify additional conditions alongside Parkinson's, such as dementia. In summary, the findings indicate that qEEG (quantitative electroencephalography) serves as a plausible and objective biomarker for PD. This is particularly relevant to EEGs, as qEEG involves a specific data analysis approach that minimizes potential bias.

EEG analysis can be effectively conducted using machine learning techniques. By inputting EEG data into artificial intelligence and a machine learning model, the time and effort required for analysis can be significantly reduced. Machine learning techniques applied to EEG data have shown promising results in identifying progression markers of PD at a relatively low cost. The classification results have demonstrated high accuracy, with values exceeding 90% in many studies. As machine learning techniques continue to evolve, they have the potential to become one of the primary methods for detecting Parkinson's Disease by analyzing EEG data to identify abnormalities indicative of the disease. It is important to note that machine learning techniques require a substantial amount of data for training to achieve optimal accuracy and

recall. Therefore, the involvement of a larger number of PD patients in EEG studies is crucial for further training the machine learning models. Additionally, the quality of EEG signals plays a vital role in obtaining accurate results, as any signal disruption can significantly impact the findings. Research conducted by Maitín, Ana María, Alvaro José García-Tejedor, and Juan Pablo Romero Muñoz (2020) provides evidence that machine learning models related to EEGs constitute a growing field, yielding precise results and hold the potential to serve as a significant biomarker for tracking disease progression. Keller et al. (2020) conducted a study analyzing tsallis entropy and the band power of theta, alpha, beta, delta, and gamma bands in baseline, with eyes-open and eyes-closed conditions using EEGs. The study encompassed 42 cognitively normal PD patients matched with 24 healthy controls based on age, sex, and education. This analysis relied on statistical software, emphasizing the potential of combining EEGs and machine learning for advancements in Parkinson's Disease analysis. This underscores the potential for machine learning, in conjunction with EEG data, to expedite the analysis of results, as observed in its ability to discern cognitive deterioration in PD patients based on the provided EEG data. The utilization of EEGs alongside machine learning models presents as a promising asset in PD research due to its high accuracy in disease identification, with the approach of training the models emerging as a rapidly embraced concept in this domain.

Discussion

The different modalities each present distinct advantages and disadvantages when applied to the identification of PD. Acoustic measures, for example, are closely associated with the motor symptoms of PD and function as a sensitive tool for early-stage detection due to their ability to capture subtle changes. When paired with machine learning techniques, the use of acoustic measures accelerates the identification process by enabling the detection of abnormal jitter, shimmer, NHR, and other vocal irregularities found in PD patients. Software such as Praat and MDVP are particularly employed in this context. This approach also offers the potential for personalized vocal therapy interventions aimed at enhancing the voice and overall quality of life for PD patients. Ongoing efforts are focused on the development of applications that facilitate at-home voice recordings for real-time analysis using machine learning models, allowing patients to monitor their results. Notably, the accuracy of such models has achieved 92% (Carrón et al., 2021). Patients are advised to record in semi-controlled conditions for accurate results.

However, it is important to note that utilizing acoustic measures for PD identification also presents drawbacks. Variations in voice changes among patients create a significant challenge in establishing consistent diagnostic criteria, potentially compromising result reliability. However, the probability of this occurrence is low, as most parameters, such as jitter and NHR, generally produce similar results across multiple studies. PD patients typically exhibit higher jitter and NHR values, and this pattern remains consistent. Moreover, factors like age, gender, environment, and the presence of concurrent diseases or vocal disorders can introduce confounding variables in acoustic measurements, potentially leading to misdiagnoses. Older individuals tend to have higher jitter and shimmer measures, and high measures in these areas

from older individuals could lead to inaccurate readings. Additionally, the overlap of PD-related voice deterioration with symptoms of other neurological conditions in advanced stages further complicates the specificity of PD identification, while the limited sample size in existing studies should also be considered. In the investigation conducted by Bang et al. (2013), a total of 14 female participants were examined, whereas in the study performed by Silva et al. (2012), a total of 27 male participants were examined. It is important to note that smaller sample sizes may lead to reduced statistical power, increased chance of bias, and failure to represent the entire population. Consequently, small sample sizes may fail to detect subtle effects in PD that could be found in larger sample sizes. Enhancing acoustic measures may involve the standardization of parameters as a critical step toward advancement, and increasing the sample size across various experiments may facilitate the identification of previously undiscovered features.

Gait measures play a crucial role in identifying PD as they directly assess motor symptoms, including tremors, which are among the most prevalent indications of the condition. Analyzing parameters such as gait speed, stride length, and cadence facilitates the detection of irregular walking patterns, making indications of PD readily identifiable. Utilizing wearable gait sensors further enhances the accessibility and application of gait measures beyond clinical settings. The precision and non-invasive nature of gait measures not only leaves a minimal margin for errors but also provides an effective means for tracking disease progression. Certain parameters, such as decreasing step count and higher cadence, could provide explicit indications of the advancement of the disease. As gait measures are quantitative and objective, the standardization of the parameters is increased. Moreover, ongoing developments in wearable gait sensor systems and the potential integration of machine learning with gait analysis, illustrated by initiatives such as those pursued by Tekscan, indicate promising advancements in gait analysis technology.

However, like all assessment methods, gait analysis has its limitations. Factors such as age, physical fitness, and musculoskeletal conditions can impact gait parameter variability, unrelated to PD. In older individuals, gait velocity decreases and cadence increases due to weaker calf muscles, leading to shortened step length. Conversely, in PD patients, these changes are attributed to tremors. As PD progresses, the symptoms, including tremors, become more pronounced, resulting in more prominent gait abnormalities. This would lead to challenges in relying solely on gait analysis for assessing early-stage PD, as finding the abnormalities would require further precision. Combining gait analysis with other modalities, such as EEG readings, is an effective approach to enhance the accuracy of PD diagnosis and monitoring. Furthermore, conducting additional clinical studies involving gait analysis in PD patients could unveil previously unidentified parameters, ultimately contributing to a deeper understanding of the disease and more accurate assessment methodologies.

EEGs present several advantages as a valuable tool for investigating PD. It provides direct insights into the brain's electrical activity, offering comprehensive information beyond motor symptoms by revealing the impact on brain structure. EEGs are easily accessible and non-invasive, making them a superior alternative to fMRIs and MRIs, which are more

challenging to obtain for analysis. EEGs effectively detect alterations in neural oscillations and connectivity, both indicative of PD. Specific changes in beta and alpha rhythms, associated with motor control and cognitive functions, are readily identifiable in EEGs, potentially indicating early signs of PD. Furthermore, the high temporal resolution of EEGs enables real-time monitoring of disease progression. By examining brain activity in the frontal regions, which house a substantial number of neurons, insights into the effect of PD on these areas and the deterioration of motor control can be gained. Utilizing quantitative EEG analysis (qEEG) provides a more detailed and objective assessment of neural dysfunctions. Integration of qEEGs with machine learning holds promise for enhancing early PD detection by identifying changes in brain waves. Additionally, EEGs are being employed to assess patient responses to PD treatments, such as medication or deep brain stimulation (DBS), offering further understanding of disease progression and therapy efficacy.

EEGs and qEEGs also present certain limitations. EEGs have limited spatial resolution and have difficulty precisely localizing neural abnormalities. This impacts the ability to identify specific affected brain regions and bands. Additionally, EEG signals can be influenced by external factors, known as noise, which complicates data analysis by introducing artifacts. While they excel at detecting changes in neural activity, EEGs and qEEGs do not offer comprehensive information on the extent of neurodegeneration, unlike fMRIs or MRIs. Advancements in EEG technology involve signal processing techniques to eliminate artifacts and reduce noise, as well as the use of high-density EEG arrays with increased electrodes for improved spatial resolution. Continuous EEG monitoring could track changes in brain activity throughout the progression of Parkinson's disease, providing valuable insights.

The potential of AI in PD is substantial. Previous research has highlighted the combination of machine learning with acoustic, gait, and EEG measures to facilitate the analysis of these modalities. Acoustic measures have benefited from tools like Praat to enhance data collection and ensure precise results. Machine learning has been crucial in assessing gait measures by determining differences in the movements of PD patients and healthy individuals. Moreover, EEG measures have shown machine learning models with over 90% accuracy in correctly identifying the disease. With further advancements in AI technology and an increased understanding of PD, the identification of the disease could potentially become more convenient, even within a home environment. The collaboration between AI and these modalities holds significant promise in striving for improved PD patient identification.

The Role of Media Coverage in Normalizing Sexual Violence of Female Athletes in American College Institutions By Isabel Gerber

Abstract

This research study examines the portrayal of sexual assault cases involving female college athletes in the media. Drawing on media analysis and framing theory, this study focuses on victim blaming, the minimization of perpetrator accountability, and gender bias. It highlights how media outlets often emphasize the behavior of the victim, such as alcohol consumption while presenting male athletes accused of sexual assault in a sympathetic light by focusing on their athletic accomplishments or future potential. These narratives not only shift attention away from the crime but also reinforce harmful stereotypes that normalize sexual violence. This research further explores the implications of these portrayals and proposes institutional changes such as adopting victim-centered reporting practices in the media and implementing comprehensive sexual violence programs on college campuses. Addressing these cultural and systemic issues can allow media outlets and universities to contribute to a broader societal shift toward accountability, safety, and survivor support.

Introduction

Sexual violence is a prevalent issue on college campuses and available research has shown that about 26.4% of female and 6.8% of male college students experience rape or sexual assault through physical force, violence, or incapacitation³. While college students are considered a high-risk group for sexual violence victimization and perpetration, female college students are at an increased risk for experiencing sexual violence. For example, the 2019 Campus Climate Survey on Sexual Assault and Misconduct found that about 1 in 4 women experience sexual assault during their pursuit of an undergraduate degree.

Among college students, athletes are often at the center of many sexual assault cases, both as perpetrators and victims³². Some research suggests that athletes may have heightened vulnerability to experiencing sexual violence. For example, one study found that college athletes may be more likely than their non-athletes to experience sexual violence victimization³². Similarly, another study examining the prevalence of sexual violence among 1004 college student-athletes found that 29% experienced some type of sexual violence since enrolling at their university, with a higher prevalence of sexual violence among student-athletes on women's teams (36%) compared to men's teams (13%)¹.

The heightened vulnerability of college athletes can be explained by the unique characteristics of athletes and the toxicity that is commonly found in sports culture. Many college athletes are part of a close-knit community on campus and primarily socialize with other athletes, spending a lot of time with their teammates in training, traveling, and sometimes even living together. While this may serve as a protective factor, it may also increase the vulnerability of athletes to sexual violence by other athletes. Additionally, athletes may be part of a toxic culture of sports that considers expressing concerns about sexual violence as a weakness and

expects athletes to maintain silence regarding victimization experiences under the guise of loyalty to the team. This dynamic can lead to athletes normalizing, ignoring, or not recognizing sexual violence as a problematic behavior. Athletes may also have educational benefits and other incentives attached to their participation in sports such as scholarships and housing. Fear of losing these benefits can make athletes less willing to report cases of sexual violence⁴⁶.

Sexual assault has short and long-term consequences for survivors. Survivors of sexual assault are at higher risk of developing depression, anxiety, and Post Traumatic Stress Disorder (PTSD). At the same time, some are forced to leave school due to trauma, affecting their future opportunities¹. For female athletes, the consequences can be even more significant, often leading to disruptions in their athletic careers and undermining their personal and professional identity.

Despite significant advancements in gender equality, the portrayal of female athletes in the media continues to reflect deep-rooted biases when compared to male athletes. A recent study found that 71% of female athletes reported experiencing sexual objectification in their sports careers³². Studies of media portrayals of female athletes reveal a tendency to emphasize physical appearance over athletic achievements⁹. Female athletes are often depicted in sexualized poses or attire, focusing on their bodies rather than their skills⁹. Women's sports also tend to receive significantly less media coverage than men's sports, and when covered, the tone often lacks the seriousness afforded to male athletes⁹. Media has also been found to use different language when discussing male versus female athletes. Words focusing on looks such as "beautiful" or "stunning" are used when describing female athletes. At the same time, commentators focus on the skill and athleticism of their male counterparts with adjectives like "powerhouse" or "dominant." News reporters often highlight femininity and attractiveness for women while emphasizing strength and skill for men⁹.

Considering the increased vulnerability of college athletes and the documented evidence of male athletes as perpetrators and female athletes as survivors of sexual violence, it is imperative to examine the intersections of media representation, language, and discourse in cases of sexual violence involving college athletes. As such, the focus of this study is to examine the media portrayals of male college athletes alleged to be perpetrators of sexual violence and female college athletes alleged to be survivors to identify similarities and differences in the representation of athletes involved in sexual assault cases. Specifically, this paper will explore the nature of the normalization of sexual violence by male college athletes against female college athletes in media representations of these cases and discuss the role of collective action to challenge and dismantle rape culture, promote survivor-centered approaches, and foster cultures of consent, respect, and accountability.

The following sections will discuss the methodology, present the findings, and explore their implications for media practices and support systems for female athletes.

Research Methods

Data Collection Procedure

This study involves a qualitative analysis of media portrayals of female college athletes as victims/survivors and male college athletes as perpetrators/offenders to examine the normalization of sexual violence and its perceived impact on the outcomes of survivors. Using the Google Scholar search engine, an exhaustive search method was employed to identify media articles that provide comprehensive and relevant information on the subject matter of this research. The following criteria were set for inclusivity:

- The article must be relevant to the topic of study.
- The article must have been authored and published in 2010 or later.
- The article must focus on perpetrators/offenders who identify as male and are college athletes.
- The article must focus on victims/survivors who identify as female and are college athletes.
- The article must be determined to be verifiable and accurate to maintain the validity of the study.

Search Strategy

Search terms were used related to female college athletes, male college athletes, and media portrayal (e.g., "female college athletes sexual assault"). Filters were then applied to ensure documents were from 2010 or later. Media articles that fit the criteria were collected and then screened for relevance.

Screening for Relevance

Initial screening involved reviewing titles and abstracts to determine relevance. Full-text screening was conducted to ensure the documents met all inclusion criteria. Documents were evaluated for authenticity and credibility, excluding any non-genuine sources. A total of 130 documents were screened, and of those, 67 matched the initial criteria. Upon further screening, a final selection of 32 articles was identified for analysis. See Appendix A for an overview of the articles analyzed in this study.

Data Analysis

A thematic analysis approach was conducted to identify and analyze patterns within the media content. A thematic analysis is a qualitative research method used to identify, analyze, and interpret recurring patterns or "themes" within a dataset (Braun and Clarke 2007). Documents were systematically coded for recurring themes related to sexual objectification, normalization of sexual violence, and mental health impacts. The codes were then grouped into broader themes to identify patterns and insights. The emerging themes identified through this analysis are discussed in the next section.

Results

The study analyzed 32 articles to document media representations of offenders/perpetrators and victims/survivors in sexual assault cases involving athletes, specifically where the male athlete is the offender and the female athlete is the victim. Three primary themes emerged from this analysis: the victim-blaming narrative directed at female athletes; the sympathetic portrayal of male athletes; and the use of minimizing language in describing the violence against female athletes.

Victim Blaming Narrative Directed at Female Athletes

Victim blaming is the act of placing blame on a victim for a crime, abuse, or other wrongful act, rather than the person who caused the harm (Oxford, 2022). Victim blaming may be direct, indirect, conscious, or unconscious (Oxford, 2022). Thirteen of the articles analyzed in this study emphasized the victims' attendance at alcohol-serving parties during coverage of sexual assault scandals that occurred at universities, suggesting that the victims' decision to attend events where alcohol was served had played a role in the assaults. According to one account, the victims "put themselves in compromising positions" by going to parties with male athletes²⁸. This wording, which exemplifies victim-blaming narratives, implies that the victims shared some of the blame for what transpired. Similarly, several articles discussing the Brock Turner³⁰ case described the victim of the assault in a way that highlighted her alcohol use at the time of the attack. For example, the use of the term "intoxicated woman," implies a subtle connection between the drunkenness of the survivor and the assault¹².

Victim blaming reinforces damaging societal perspectives on sexual violence that imply survivors are responsible for changing their behavior to prevent victimization. These damaging perspectives can be understood as rape myths. Rape myths refer to incorrect beliefs about rape that validate or pardon sexual aggression and place responsibility on survivors²⁵. Multiple studies have consistently demonstrated that the acceptance of rape myths is connected to an increased tolerance for sexual violence and a decreased level of empathy toward survivors¹⁹. Victim-blaming language shifts attention to what the survivor could have changed about their behavior or actions to prevent instances of sexual violence instead of holding perpetrators accountable for sexual violence. Available research indicates that when media stories focus on the survivor's actions, it leads to decreased conviction rates and more critical assessments of the survivors²⁴. The critical assessment of survivors often misleads the general population's comprehension of consent, responsibility, and accountability in instances of sexual violence.

In the Brock Turner case, the media primarily focused on the victim's intoxication rather than on the fact that Turner exploited her while she was unconscious. This is consistent with Robert Entman's concept of a "moral evaluation" frame (1993), in which the media subtly critiques the victim's actions while downplaying the perpetrator's responsibility. The media's

³⁰ The Brock Turner case involved a former Stanford University swimmer who was convicted of sexually assaulting an unconscious woman in 2015, sparking widespread outrage due to the lenient six-month sentence he received, which highlighted issues of privilege, victim-blaming, and the treatment of athletes in sexual assault cases.

focus on the victim's behavior adds to a culture of blaming victims, impacting the public's perception of sexual assault as a grave and violent offense. This framing is also crucial in victim-blaming when the victim is ultimately held responsible, either implicitly or explicitly. Benedict (1992) points out that the media frequently criticizes the actions of victims, implying that they could have prevented the attack by behaving differently. This may involve examining if the victim consumed alcohol, her attire, or her reason for being at a specific location at a specific time. These stories subtly suggest that the victim shares some blame for the attack, lessening the perpetrator's accountability. This story can be especially damaging for women in college sports, making them less likely to report out of fear of being disbelieved or blamed for their victimization.

Victim-blaming narratives against female athlete survivors of sexual violence can also result in the lack of accountability for male athletes who perpetrate sexual violence. Lack of accountability refers to the absence of processes, norms, and structures that hold individuals legally or otherwise responsible for their actions and impose corrective actions and sanctions if they violate laws or policies in place to guide their conduct. Victim blaming is considered a lack of accountability for perpetrators because it shifts the focus away from the actions of the abuser and instead places the blame on the victim, essentially excusing the perpetrator's behavior and allowing them to avoid responsibility for their harmful actions.

The Sympathetic Portrayal of Male Athletes

Another recurring theme identified in the analysis of media articles is the sympathetic portrayal of male athletes alleged or found to have committed sexual assault. Findings revealed that sexual offenders were often described more sympathetically in 19 media articles. This was especially evident in the portrayal of male athletes in media articles that referenced the offender's grief over the situation, unfulfilled potential, and bright futures more than the sexual offense committed. For example, Brock Turner was frequently characterized as a "Stanford swimmer" and a "promising athlete" whose life was "tragically altered" by the conviction¹⁵. Furthermore, his athletic celebrity was emphasized in headlines such as "Former Stanford Swimmer Gets Six Months in Jail for Sexual Assault"¹⁵. In another article, reporters documented how Brock Turner's father argued in court that punishing his son severely for "20 minutes of action" would be excessive and damaging to his future with no mention of arguments made regarding the impact of the assault on the survivor⁴¹. The references to Brock Turner's athletic capabilities and the disruptive effect of the sentence he received for his crime implicitly present Turner's punishment as a tragedy.

The compassionate representation of offenders in media articles is not unique to the Brock Turner case. This representation was a common theme in media reports of male athletes facing sexual assault allegations. For example, media articles describing sexual assault allegations against the University of Colorado's football team emphasized the possible career consequences of these accusations on athletes and the team if found guilty. According to a local news station, the claims would "threaten the football team's reputation" and "jeopardize

scholarships and future careers" ¹⁶. These examples highlight how male athletes are often portrayed as individuals with much to lose, making their misconduct seem less serious because of their status. This sympathetic representation was further highlighted in the media coverage of the Baylor University sexual assault scandal, in which several football players were accused of sexual violence. Furthermore, the media coverage of the case concentrated on the scandal's effect on the football team and the players' future, rather than emphasizing the survivors' suffering ¹⁶.

Male athletes, especially those at the college or professional level, frequently experience a level of privilege and esteem in society. According to Michael Messner in "Taking the Field: Women, Men, and Sports" (2002), male athletes are often seen as role models, representing values such as discipline, strength, and achievement. Consequently, the media tends to positively depict male athletes accused of sexual assault, highlighting their athletic accomplishments or potential for future greatness. This may result in the public feeling more sympathetic towards the perpetrator instead of the survivor, as their reputation as an athlete seems to overshadow their reputation as a criminal.

This sympathetic portrayal of offenders can stir compassion for the criminals while downplaying the harm done to the survivors. The compassionate portrayal of male athletes who are offenders has a significant impact on female sexual assault survivors. When the media prioritizes the perpetrator's future outcomes over the survivor's experiences, it may diminish the survivor's ordeal and suggest that the impact on the perpetrator is valued more than the impact on the survivor. Furthermore, the sympathetic portrayal of offenders in media articles may deter other survivors from reporting their assault as survivors may be concerned about not being believed or supported because of the perpetrator's status. Survivors may also lack confidence in institutional systems of accountability.

In many cases, victims face secondary victimization when they are re-traumatized by the responses from the public and legal system after the assault. When the media focuses on the achievements and future possibilities of the wrongdoer, it continues to promote the idea that male athletes are too significant to experience complete repercussions and that the suffering of the victim is less important than the wrongdoer's opportunities.

The sympathetic portrayal of male athletes aligns with the discoveries in Bell Hooks' 2000 book, *Feminist Theory: From Margin to Center*. Hooks criticizes the way patriarchal systems in media frequently exclude women's experiences and uphold male-centric stories. She contends that the presence of patriarchal concepts in media representations contributes to the normalization of sexual assault by favoring male perspectives. When the media highlights the future potential of male athletes instead of the crime, it downplays the lived experiences of female victims. This patriarchal structure reinforces a society where the male point of view is given priority while minimizing or dismissing the harm inflicted on women. Consequently, the public perception may be to forgive the behavior of male wrongdoers, especially if they are athletes or influential individuals.

The Use of Minimizing Language in Describing Violence Against Female Athletes

The use of minimizing language in reports of sexual assault incidents was another theme identified in this analysis. Specifically, fourteen articles described the sexual assault incident using language that minimized and normalized the sexual assault. For example, media outlets describing sexual assault claims against the University of Oregon male basketball players referred to the assault as "misconduct" or "misunderstanding" instead of using the term "sexual assault" ⁴². Similarly, reports regarding the sexual assault case at Baylor University placed more emphasis on the institutional response—or lack thereof—than on the actual crimes. In another example, a media article about the case used the title "Baylor Faces Scandal Over Player Behavior" ¹⁶. The use of the term "behavior" instead of "sexual assault" fails to reflect the seriousness and gravity of the player's alleged actions. This form of linguistic avoidance when describing sexual assault incidents against female athletes takes away from the seriousness of the offense and reinforces societal attitudes that undermine the gravity of these situations. This further demonstrates the news station's apparent backing for the offender. Sexual assault is sometimes minimized or reframed in media narratives as a less serious crime, which diminishes the severity of the act.

Discussion

Impact of Media Representation

The framing theory, presented by Robert Entman in 1993, provides a perspective to analyze the impact of media on public perception. This theory suggests that the media doesn't just write about events but also influences how people perceive them by highlighting some aspects and downplaying others. The frames chosen impact how the audience understands the story. Entman suggests that framing entails highlighting specific elements of reality to emphasize a certain problem definition, causal interpretation, moral evaluation, and/or treatment recommendation. This method is particularly important when it comes to the media's reporting on sexual assault, as it can highlight the gravity of the offense or redirect focus to the individual repercussions for the perpetrator, especially if they are a well-known male athlete.

Impact of Perpetrator-Centered Narratives

The media perpetuates damaging stereotypes and misunderstandings about rape by portraying perpetrators, especially male athletes, in a sympathetic manner. These stories create a cultural atmosphere where sexual assault is minimized and not fully comprehended. Consequently, the public's view of rape is distorted, leading to more empathy being shown towards the perpetrator rather than the survivor. Emphasizing male athletes' possible career setbacks or future goals creates a misleading division where the assault is seen as a regrettable error that might destroy promising prospects, instead of acknowledging it as a serious crime with an enduring impact on the victim.

This portrayal by the media can continue harmful misconceptions about sexual assault, like suggesting that perpetrators are "decent guys" who just happened to make one mistake, rather than accepting full responsibility for their behavior. Emphasizing the impact on the

offender's career instead of focusing on the victim's trauma contributes to a culture that excuses and normalizes rape. Following hooks' (2000) feminist analysis, emphasizing the male point of view in media stories maintains patriarchal hierarchies by prioritizing men's futures over the well-being of the women they hurt. The media is crucial in upholding gendered power dynamics by shaping public discourse.

Conclusion

This research has unveiled and reestablished several critical themes of how media articles portray sexual assault cases involving female college athletes in the United States. One key takeaway this study has shown is that the media coverage often engages in victim blaming, emphasizing the victim's actions such as alcohol consumption or choice of social activities, rather than focusing on the crime itself. This victim blaming narrative not only implies that the victims could have avoided the assault if they had behaved differently but also shifts accountability away from the perpetrator. The depiction of male athlete perpetrators in mass media also reveals a common theme of sympathetic portrayals found throughout. The articles tended to focus on the perpetrator's athletic achievements or future potential, in turn minimizing the severity of their actions and subtly suggesting that their status as athletes justifies leniency. Framing like these both normalize sexual violence and detract from holding the perpetrators accountable, which can perpetuate harmful cultural narratives.

Media content publishing companies play a pivotal role in shaping public perception, so these findings can have significant implications for various stakeholders. Their portrayal of sexual assault cases can either challenge or reinforce existing stereotypes so failure to adopt a balanced and victim-centered reporting approach can contribute to a culture of tolerance towards sexual violence. Furthermore, several other institutional changes can be made to reduce the normalization of sexual violence. For example, these findings should move college administrators beyond mere compliance with federal laws like Title IX. They should also actively be working to curb the normalization of sexual violence by addressing cultural factors, including those in sports programs, which can contribute to these attitudes. Taking a proactive approach to addressing this issue by creating comprehensive educational programs focused on consent, respect, and consequences of assault should become a standard across campuses in America. These programs should especially target sports teams and other high-profile groups that are known to be perpetrators, to break down the culture of entitlement often associated with them. Universities should also ensure that their reporting mechanisms support survivors and provide them with the necessary psychological, medical, and legal resources while maintaining a clear stance on a zero-tolerance policy towards sexual violence. Implementing educational campaigns and strict institutional policies focusing on prevention and accountability for all students, regardless of their status, are crucial to making a ripple of change throughout college campuses.

Along with that, creating guidelines in media organizations that cover sexual assault cases that prioritize the victim's experience and use accurate unbiased language can greatly

modify the discourse. News outlets can take steps to actively support victims by avoiding terms that minimize the crime such as “misconduct” and refraining from framing perpetrators based on their athletic or social potential.

By making these changes media outlets and college campuses can work together to shift the narrative surrounding sexual assault by placing a greater focus on survivor support and accountability for offenders. These things can help dismantle the systemic issues that contribute to the continued normalization of sexual violence on college campuses and hopefully make it a lot safer for women to get an education.

The findings of this study also provide relevant information to inform future research on this topic. Specifically, future research can ally quantitative and qualitative approaches to document the first-hand experiences of victimization among female college athletes whose cases have been documented in media reports. Future research can also examine public perception of media reports on sexual assault cases involving female athletes as survivors and male athletes as perpetrators among college athletes specifically and college students broadly. Exploring these topics can inform interventions and awareness education efforts to address the problem of sexual violence among college athletes. Furthermore, future research can explore the media representation of athlete-involved sexual assault cases on college campuses involving individuals of diverse racial/ethnic backgrounds to document the differential impact of race/ethnic identity on portrayals of perpetrators and survivors. Doing so can contribute to the empirical literature on the role of socio-cultural factors in media portrayals of sexual violence cases involving athletes.

The Semiconductor Industry & Geopolitics By Ian Chiang

Abstract

Semiconductors underpin the technological infrastructure of the digital age. From smartphones and laptops to advanced artificial intelligence and military systems, semiconductors play an essential role in shaping the global economy and powering innovation. As described by Moore's Law, the exponential growth in computing power has driven rapid advancements in the semiconductor industry. This sudden evolution has propelled the industry into a strategic sector critical to nations' national security, economic competitiveness, and technological leadership. Over the past few decades, the semiconductor industry has undergone significant shifts, evolving from vertically integrated models to specialized, pure-play chip design and manufacturing sectors. Key players like Taiwan, South Korea, and the United States have emerged as leaders in advanced semiconductor production. At the same time, China's push for self-sufficiency in the wake of U.S. export controls has reshaped the global competitive landscape. At the same time, geopolitical tensions are creating new challenges and opportunities as countries recognize the strategic importance of controlling semiconductor supply chains. This paper examines the evolution of the semiconductor industry, the geopolitical ramifications of its supply chains, and the future trajectory of global competition in this critical field. By analyzing key historical developments, current trends, and emerging challenges, this study suggests that China will pursue domestic production of mature-node semiconductors. In contrast, the United States will pursue domestic manufacturing of advanced semiconductors, possibly enabling an edge over China in future science, conflict, and politics.

Introduction

In early 2021, workers at Ford's manufacturing plant in Louisville, Kentucky, stood idle as the assembly line came to a grinding halt. Forced to temporarily close the plant, Ford halted production of thousands of cars and trucks. Across the industry, automakers scrambled to adjust, delaying the release of new models, cutting back on production, and subsequently losing billions in revenue (Shreve, 2021). The culprit wasn't a lack of steel or labor—it was the absence of semiconductor chips. A shortage of these crucial tiny components was now at the center of a global crisis (Brinley, 2023). As the world progresses towards digital dependency and new technologies like artificial intelligence (AI) are becoming more mainstream and ubiquitous, the necessity for a continuous supply of semiconductors is fundamental to running the world.

Semiconductors in Context

Semiconductors are materials with specific electrical properties that comprise the foundation of all computers and electronic devices. Since the inception of the semiconductor in the early 1950s, computing power has exponentially increased with the physical size of the “chips” miniaturizing into nanometers today (Arcuri, Shivakumar, 2022). While the operational structure of the semiconductor industry remained largely constant for almost 30 years, its

business model changed significantly during the 1990s and 2000s, termed the “Fabless Revolution (referring to the fabrication plants where semiconductors are manufactured),” where semiconductor companies began focusing exclusively on either designing, “fabless,” (without a fabrication plant) or manufacturing semiconductors to become more competitive and, by doing so, increase profit margins (Miller, 2022). Both sectors only comprise a handful of companies. Major design and manufacturing companies include AMD, Intel, Nvidia, TSMC, Samsung, ASML, and others. These companies control most of the industry, providing the world with the ongoing need for computing power. According to Chris Miller’s seminal work *Chip War*, each year, Taiwan provides 37% of the world’s new computer power; two Korean companies produce 44% of the world’s memory chips; and the Dutch company ASML makes 100% of the world’s ultraviolet lithography machines, without which, semiconductors could not be manufactured.

Since 2018, the U.S. has restricted the export of advanced semiconductor technology to China on national security and domestic economic activity concerns. Through these restrictions, the U.S. aims to limit China's access to cutting-edge chip design, technology, and manufacturing techniques (Freifeld, 2024). In response, China is subsidizing domestic firms and focusing on mass-producing older chip technology, which can still be used in many consumer electronics and automobiles (Miller, 2022). However, China faces significant challenges in competing with Western firms on advanced technologies like Extreme Ultraviolet (EUV) lithography (fundamental to manufacturing semiconductors), as it entered the industry too late to benefit from economies of scale (Miller, 2022). On the other hand, countries like Taiwan, South Korea, and the U.S. have directly benefited from decades of semiconductor investment, allowing this handful of nations to dominate any competition (Miller, 2022).

Economies of scale are significant in the semiconductor industry, which is capital-intensive, requiring significant upfront investments, advanced expertise, and state-of-the-art equipment. Only highly skilled labor can drive the innovation needed to stay competitive, but attracting this talent can be difficult due to visa and immigration barriers. Additionally, geopolitics plays a crucial role, as countries must align themselves with specific supply chains, which can limit their access to resources if they fall on the opposing side of global trade conflicts, such as the U.S.-China Trade War (Shivakumar, Arcuri, Wessner, 2022).

Historical Context

Semiconductors are the foundation of all modern computers and electronic devices. In 1947, the transistor revolutionized technology by enabling faster and more efficient computation than previously capable, leading to the development of the integrated circuit in 1958-1959 (Miller, 2022). The integrated circuit combined multiple electronic components onto a single chip, sparking exponential growth in computing power and laying the groundwork for the modern chip industry. A year later, semiconductor companies, such as Fairchild Semiconductor, settled and established their hub in what is known as Silicon Valley today (Miller, 2022). Gordon Moore, co-founder of Fairchild, predicted that the number of transistors on a chip would double

annually. Known as “Moore’s Law,” this characterized rapid advancements in miniaturized technologies in the following decades (Miller, 2022).

As the chip industry grew, U.S. companies began offshoring labor-intensive chip assembly to Asia in the late 1960s and 1970s to reduce costs. Many semiconductor firms set up manufacturing facilities in Hong Kong, Malaysia, and Singapore, capitalizing on the region’s emerging economies and cheaper labor (Miller, 2022). The pursuit of low-cost manufacturing set the template for the globalization of electronics manufacturing. However, U.S. dominance in the memory chip market was challenged by Japanese firms. Armed with government subsidies and superior R&D, Japanese manufacturers achieved higher quality and yields, leading to trade tensions with the U.S. as many American firms could not compete. To counter Japan’s dominance, the U.S. government formed research consortia like Sematech to improve domestic competitiveness. This slowly eased the U.S. chip industry’s recovery over time. Yet these hurdles did not stall the American industry’s advancement. Specifically, in the 1980s and 1990s, firms specialized in two major niches: “fabless” chip design and manufacturing. Many U.S. firms continued to lead in chip design while cutting-edge manufacturing was increasingly outsourced to Asia, with Taiwan and South Korea emerging as key players. This model lowered barriers to entry for chip designers and allowed for greater specialization across the value chain (Miller, 2022).

With the explosion of smartphones and mobile computing in the 2000s, the pure-play fabless/fab model was tested. Massive demand for advanced chips drove innovations in power efficiency, miniaturization, and processor specialization while the demand for mobile devices boosted the need for high-performance memory and wireless modems (Miller, 2022). By the 2010s, China emerged as both the largest market and a major new player in the global chip industry (Miller, 2022). Concerned with its reliance on foreign chips, the Chinese government launched a major push to develop domestic semiconductor capabilities, investing over \$100 billion through entities like the National Integrated Circuit Industry Investment Fund (“Big Fund”). China acquired foreign chip technology through mergers, forced technology transfers, and industrial espionage to maintain competitiveness and catch up with emerging technologies. As a result, domestic champions like SMIC and Tsinghua Unigroup grew significantly. In response to the Chinese government’s policies, the U.S. government restricted China’s access to American chip technology on national security grounds, such as the blacklisting of Huawei in 2019 (Miller, 2022).

As the semiconductor industry gains prominence on the world stage, the rising costs and risks associated with pushing the physical limits of chip technology, such as the increasing manufacturing defect rates and the “end of Moore’s Law,” bring into question the industry’s future trajectory and its implications for the global balance of economic and military power.

The Iron Fists in Velvet Gloves

The cost of building semiconductor fabrication plants (fabs) has increased drastically over the years. In the late 1960s and 70s, a fab cost around \$4 million (or \$31 million in 2024

USD Today, fabs cost billions, with Intel constructing two in Arizona at \$15 billion each and Samsung's fab in Texas expected to reach \$25 billion (Potter, 2024). TSMC's "Fab 15" and "Fab 18" cost \$13.4 billion and \$21.2 billion, respectively (Potter, 2024). This surge in costs mirrors Moore's Law, as increasing the number of transistors on a semiconductor raises production expenses (Potter, 2024). Recently, TSMC founder Morris Chang revealed that developing 3nm (3-nanometer chip) manufacturing facilities will cost in excess of \$20 billion (Ellis, Gao, Wang, 2017). TSMC spends about \$10 billion annually to keep its manufacturing facilities up-to-date, emphasizing that having the most advanced manufacturing technology is key for TSMC to maintain profitability and competitiveness, especially against other brands, such as Intel and Samsung (Burton, 2017).

Building modern fabs is a massive undertaking. Intel's fabs reportedly use twice the concrete as the Burj Khalifa and five times the metal used in the Eiffel Tower. Its new Magdeburg fab will require over 9,300 workers, while TSMC's Arizona fab is expected to require 12,000 (Potter, 2024). Approximately two-thirds of fab costs stem from services like ultrapure water systems, exhausts, and large-scale HVAC systems, which are crucial for maintaining clean rooms—essential in chip manufacturing, as even a speck of dust can destroy a chip (Potter, 2024). Equipment costs are also significant, with lithography machines making up roughly 20% of the total fab operation expense (Potter, 2024).

Two main factors drive up fab operation costs: the complexity of lithography machines and the density of transistors. While cutting-edge processors require \$10-20 billion in investment, less advanced chips, like memory chips, are significantly cheaper to produce (Potter, 2024).

Fig 1: Cost Breakdown of a Semiconductor Fab

The 2022 CHIPS and Science Act aims to strengthen U.S. leadership in the semiconductor industry by allocating \$52.7 billion for semiconductor research, development, manufacturing, and workforce development (The White House, 2022). This includes \$39 billion in manufacturing incentives, with \$2 billion earmarked for “legacy” or “mature-node” chips (older, more reliable chips with transistors larger than 28 nanometers compared to advanced chips <7nm, typically used in industries where advanced computation is not required such as infrastructure and automotive electronics). Additionally, \$13.2 billion will be allocated for research and development and workforce training and \$500 million for international communications technology security and semiconductor supply chain initiatives (The White House, 2022). The CHIPS Act also offers a 25% investment tax credit for capital expenses related to semiconductor manufacturing and associated equipment (The White House, 2022). The Commerce Department is authorized to support up to \$75 billion in loans and loan guarantees to advance semiconductor projects (Department of Commerce, 2022). Commerce Secretary Gina Raimondo stated that these investments aim to put the U.S. “on track to produce roughly 20% of the world’s leading-edge logic chips by the end of the decade,” a significant increase from the current 0% (Ngo, 2024). However, some skepticism remains about the program's potential impact. A 2020 study suggested that a \$50 billion investment might only increase U.S. market share to 14% (Ngo, 2024).

The \$52.7 billion allocated by the CHIPS and Science Act for new U.S. semiconductor fabs is a positive step, but when compared to the cost of constructing advanced fabs like TSMC’s

Fab 18, which required \$21.2 billion alone, it becomes clear that these subsidies will not match Taiwan's manufacturing capacity. Even with potential additional funding from the \$75 billion in loans through the Commerce Department and the \$200 billion in private investments, U.S. semiconductor manufacturing will not reach Taiwan's level in the expected timeline of the CHIPS Act. As TSMC founder Morris Chang emphasized, achieving this scale takes decades, not just financial investment. While the subsidies aim to improve U.S. manufacturing, the funding is insufficient to reclaim the U.S.'s former position as a manufacturing leader, especially with domestic demand for semiconductors continuing to grow. U.S. chip consumption is increasing, according to *Statista*, but current domestic production capacity is unable to meet demand, making the challenge even greater.

Fig. 2: Semiconductor sales in the Americas from 2012 to 2024, by month (in billion U.S. dollars)

National security concerns aside, offering billions in incentives for semiconductor investment does not ensure that this level of investment will happen, nor does it guarantee that any resulting investments will be effective or productive (York, Bhatt, 2023). The limits that the U.S. and its Western allies have imposed on exporting advanced chip technology, research, and human capital to China has pushed Beijing to strategically shift from advanced chip manufacturing to high-volume mature-node chip production, as China cannot catch up to current “advanced chip” manufacturing techniques when isolated from the global supply chain.

While the U.S. aims to regain technological dominance by pushing for cutting-edge semiconductor advancements, China is taking a different path. Beijing recognizes that it may be unable to catch up to Western countries’ advanced chip manufacturing capabilities, primarily due

to the U.S. and its Western allies' import restrictions on advanced chip technology, research, and human capital to China. As a result, China has strategically pivoted to focus on high-volume production of mature-node chips. This means that the U.S. and China are competing in different areas of the same industry, unlike the narrative of direct head-to-head competition advanced by both governments and media in recent times. Instead, the U.S. and China are carving out their niches.

That said, the world will experience distinct changes due to the U.S. and China's approaches. China will most likely gain market dominance in the production of mature-node chips, where it can leverage economies of scale. Their market dominance will have far-reaching effects in every semiconductor market across the globe. This is apparent with China's Belt and Road Initiative. While the program has faced significant challenges with debt burdens and a stagnating Chinese economy, the Chinese Communist Party (CCP) has reorganized its economic assistance to more sustainable development (Ministry of Finance (PRC), 2023). Instead of directly investing in affiliated countries, China could grow the computing power market by offering low-cost chips for infrastructure, agriculture, mining, and other developments. The smaller economies of Southeast Asia, in particular, are attracted to Belt and Road because it bridges the developmental gaps within and across national boundaries (Kuik, 2021). This will only help the Chinese mature-node market dominance.

According to Chang, however, technological expertise can't be bought with money alone. He cautions that several new companies, particularly in China, might build more capacity than the market can sustain. While China's efforts to expand its semiconductor industry may yield some success, it won't meet the government's high expectations as quickly as anticipated (Ellis, Gao, Wang, 2017). On the other hand, since the U.S. wants to maintain economic competitiveness in advanced chip technology and is pursuing domestic manufacturing, they will have a clear advantage in industries that rely on these chips, such as AI, quantum computing, and advanced military technology. Extrapolating into the future, we can expect to see the US further its global hegemony with the advancements in these critical industries. US science will continue to be a major player around the globe as demand for domestically grown AI, quantum computing, and other technologies continues to increase. However, unlike China's strategy, US investment is riskier. Attempting to move Taiwan's success into a new geographic area while developing new innovative chips presents more points of failure in domesticating production.

To an extent, U.S. military hegemony could grow as a result of continued investment in the advanced chip industry. Emerging military technology will not only possess greater power but also advanced intelligence, reinforcing the U.S.'s position as the world's leading military superpower. Recently, many nations have pursued programs optimizing strategic military coordination through artificial intelligence. Acting as a pseudo-military commander, these AI systems were designed to assist the efficiency of military commander's decisions. War is fast, and making a tactical decision a second faster is the difference between life and death. But the use of these programs is not far off, many have already been implemented. In 2017, the U.S. Pentagon initiated "Project Maven" to help manage and interpret the massive volumes of photos

and videos taken by drones in Afghanistan and Iraq. The project was able to produce computer-vision detections for “warfighter requirements,” essentially assisting the strategic decisions of soldiers on the ground by highlighting potential threats (The Economist, 2024). Likewise, China has pursued a similar interest. In 2022, the Pentagon released its annual report on Chinese military power, highlighting that the People’s Liberation Army began discussing “MultiDomain Precision Warfare” or using big data and AI on the battlefield (The Economist, 2024). While there is a notable gap in military technology, experience, and equipment between the U.S. and Chinese militaries, further U.S. investment in the advanced chip industry will only exacerbate this gap, especially as AI evolves with new advanced semiconductors.

Conclusion

Looking into the future, we can expect to see the dynamic world of semiconductors evolving. While many aspects could change, there are a few specific points to watch: American fabs, the 2024 U.S. Presidential election, and Asian geopolitics. The impact of U.S. government incentives on the domestic semiconductor industry could mean hastened or stalled domestic advanced chip production. While it is almost certain that America’s semiconductor manufacturing technology and techniques are leagues behind TSMC’s, there is a good chance of positive growth in domestic semiconductor manufacturing. However, this is not guaranteed. Considering China’s history of over-subsidizing different industries and achieving subpar results, the U.S. government should be wary about where and how taxpayer money is being allocated, especially if the U.S. expects to produce about 20% of the world’s advanced logic chips by the end of the decade.

The future of U.S. chip production will not solely be determined by U.S. incentives, however. The re-election of Donald Trump in the 2024 U.S. Presidential election is poised to significantly influence the future of U.S. chip production. Under the previous Trump administration, there was a strong emphasis on bolstering domestic manufacturing and implementing stringent trade policies, particularly concerning China. Despite Mr. Trump’s skepticism towards the act (Wiles, 2024), it is anticipated that a complete repeal of the CHIPS Act is unlikely (Butts, 2024). As Trump’s Administration closely follows a stringent stance toward China, Trump may seek to alter some aspects of the legislation while maintaining the overarching goals of enhancing U.S. competitiveness in semiconductor manufacturing (Butts, 2024). House Speaker Mike Johnson's statement reflects this sentiment: “...there could be legislation to further streamline and improve the primary purpose of the bill [CHIPS Act],” referring to the Republican Party’s economic policy attitude (Groves, 2024).

Trade regulations are also expected to be affected. The Trump administration previously imposed advanced chip export restrictions to safeguard national security interests. With Trump's return to office, these restrictions will likely be tightened, as Trump intends to apply tariffs to a 10-20% tariff on all imports and at least a 60% tariff on Chinese imports (York, 2024). This reflects a cautious stance toward trade relations with China and a focus on protecting critical technology industries.

Lastly, as both countries pursue de-globalizing self-sufficiency measures in chip production, contention in the region could increase. Specifically, any escalation between Taiwan and China could severely disrupt the industry. Despite U.S. domestic production, the U.S. and its allies are likely to continue supporting Taiwan economically and militarily to ensure the stability of this critical supply chain, which could further strain U.S.-China relations and impact regional security dynamics. Because of this flashpoint, stronger alliances between the U.S., Taiwan, South Korea, and Japan are likely as these countries work to secure supply chains and technological superiority over China. More significantly, Asian countries will increasingly have to navigate the semiconductor rivalry between the U.S. and China, with some countries aligning with the U.S.-led supply chain and others deepening economic ties with China, leading to a more fragmented Asian geopolitical landscape.

Addressing the Microplastic Crisis: The Potential of Genetically Engineered Tardigrades With *I. sakaiensis* By Abdulrahman Sidani

Abstract

Microplastic pollution is one of the most threatening pollution crises to date. It affects the health and sustainability of all ecosystems across the globe. Innovative and large-scale solutions are required to combat this crisis on a global level. A literature review was utilized to determine the feasibility of genetically engineering tardigrades with the abilities of *Ideonella sakaiensis* to break down polyethylene terephthalate. The current body of scientific literature suggests that there is potential for such efforts, but substantial research is required prior to execution. In particular, current findings are limited by a lack of data on the real-world applications of, first, developing genetically engineered tardigrades and, second, deploying them into marine ecosystems.

Keywords: CRISPR, Tardigrades, *Ideonella sakaienes*, Microplastics

Introduction

The smallest things can create our biggest problems. Experts say we now live in what is known as the *plastic age* due to our overreliance on synthetic polymers in most aspects of our lives (Harrison et al.). Plastic is the most abundant and continuously growing man-made pollutant on Earth; it has been prominent for nearly a century and has increased 600-fold since the 1950 (Harrison et al.). Polyethylene terphthalate (PET), the main compound used in a majority of plastic products due to its durability and versatility, is what deems plastic pollution to be so harmful (Dhaka et al.).

Although the issue of plastic pollutants is devastating enough, the consequence of their degradation, microplastics, poses a greater threat. Microplastics are defined as plastic fragments smaller than 5 mm. They can originate from any plastic source, such as polyester clothes or plastic containers (Wagner et al.). Microplastics are easily able to resist physical and biological degradation (Harrison et al.). Studies consistently demonstrate that microplastics are widespread globally, with an estimated range of 12.5-125 trillion microplastics in existence (“Microplastics Have Moved into Virtually Every Crevice on Earth”). Their persistence in the environment, as well as the difficulty of removing them, require innovative solutions.

Scientists have only recently begun investigating the impacts of plastics on humans and the environment. Microplastics have been found to disturb marine ecosystems and food chains, contaminating animals and poisoning organisms that consume these contaminated individuals (Smith et al.). Plastic contamination is prevalent in drinking water, with six landmark studies demonstrating that at least 24% of publicly available drinking water is contaminated with microplastics (Danopoulos et al.). Human consumption of microplastics poses severe health risks, such as inflammation, lipid metabolism disturbances, gut microbiota dysbiosis, neurotoxicity, lower fertility rate, and, most notably for the purposes of this research, oxidative

stress (Lee et al.). These effects also apply to aquatic organisms (Zolotova et al.). Directly or indirectly, microplastic pollution negatively affects aquatic and terrestrial creatures alike. A decreased fertility rate and increased death rate caused by the adverse effects of microplastics can disturb global food chains and threaten human accessibility to clean food supply as well as aquatic ecosystems' sustainability. With this growing number of studies demonstrating the negative impacts caused by microplastics, they have now been recognized as an international threat to both human and environmental health.

Given how critical the plastic pollution crisis is, expert intervention is critical. The quantity and rate of spread of plastic across the globe renders manual pick up a trivial solution. Since PET is extremely resilient to physical degradation, waiting for plastic to simply decompose is not a viable option. As such, biodegradation is not ideal to counter the plastic pollution crisis. Despite strong plastic resistance to most forms of biodegradation, recent discoveries have found promising exceptions. Most notably, the bacteria *Ideonella sakaiensis* (*I. sakaiensis*) has been found to be capable of consuming PET and breaking it down into organic compounds via the production of enzymes IsPETase and IsMHETase (Li et al.). Unfortunately, the bacteria are found in niche living conditions which limits its ability to counter the plastic pollution crisis (Widyastuti). To counteract this limitation, scientists are now considering the use of new genomic technology to boost *I. sakaiensis*' impact: Clustered Regularly Interspaced Short Palindromic Repeats (CRISPR). CRISPR describes DNA fragments that bacteria utilize as an immune system. These DNA fragments are created when a bacterium is infected by a foreign species, ultimately storing fragments ('sequences') of the genetic code of infecting species within the bacteria genome. This is advantageous because, if the same species infects the bacteria again, the bacteria will recognize it and release a Cas9 protein that will cut off the portion of the foreign specie's genetic code that was previously stored by the bacteria (Mayo Clinic).

CRISPR was first pioneered by Scientist Francisco Mojica in 1993, but it was not until 2013 that this biomechanic was first used for gene editing purposes ("CRISPR Timeline"). One example of CRISPR being utilized is in the alteration of hemoglobin variants in patients with Sickle Cell disease (Rheney). CRISPR also has multiple other applications such as controlling transcription and conducting genome-wide screens⁶.

Scientists have now been exploring the use of CRISPR to cut and paste desired DNA sequences for a variety of applications (Mayo Clinic). For example, researchers inserted the DNA sequence of the bacteria *A. chroococcum* that allows it to live in neutral and alkaline soils (ATCC 4412) into the genome of *I. sakaiensis*. The process resulted in a generation of *I. sakaiensis* that was capable of surviving in soil, thereby introducing the possibility for it to consume plastic in additional locations (Widyastuti). Although this CRISPR experiment was successful, one current limitation with the genetically engineered bacteria is their inability to live in marine environments — where a majority of plastic waste is located. To combat this, a different study applied genetic engineering to *I. sakaiensis* by taking its DNA sequence that produces the enzymes IsPETase and IsMHETase and inserts it into *V. natriegens*, a marine-based bacteria. As a result, *V. natriegens* was able to break down PET into organic material (Li et al.).

Although this study is promising, the rate of PET depolymerization in high salt conditions was significantly slower compared to *I sakaiensis*, limiting *V. natriigen*'s ability to be efficient in oceans with high microplastic concentrations (Li et al.). This limitation is significant because most microplastics reside in areas with high-salt concentrations such as oceans.

Although genetically engineering *Ideonella sakaiensis* with other bacteria, or vice versa, appears promising, the option is only as efficient as the candidate that *I. sakaiensis* is genetically engineered with. One candidate that is ripe for consideration is the tardigrade. Tardigrada, also known as tardigrades or 'water bears', are microscopic aquatic invertebrates (Miller). These water bears have been proven to have strong resilience and adaptability. This includes tolerance to extreme temperatures, radiation, and a lack of water (Kasianchuk et al.). Such adaptability grants them the ability to live in nearly every habitat on earth, ranging from mountain tops (6 km) to the deep sea (-7 km) (Wright). The various environments that the tardigrade inhabits and the extreme resilience capabilities it possesses accounts for both the limitations of *I. sakaiensis* and the bacteria it has been genetically engineered with in other studies. With that being said, despite the tardigrade's qualifications, there is a gap in the research testing if genetic engineering between tardigrades and *Ideonella sakaiensis* is possible, and what consequences would result from this genetic engineering.

In order to address this research gap, this research conducted a literature review to gauge whether tardigrades, genetically engineered with *I. sakaiensis*, are a feasible option for mitigating plastic pollution. This paper explores the feasibility of genetically engineering tardigrades with *Ideonella sakaiensis* using CRISPR technology to develop a novel and effective approach to mitigate the microplastic crisis.

Methods

This research will find peer-reviewed journal articles on Google Scholar (www.google.com/scholar) using the keywords: ('tardigrades') AND ('CRISPR' OR 'Cas9' or 'genetic engineering' or '*I. sakais*'). Articles were deemed relevant if they involved discussion on genetic engineering related to tardigrades or *I. sakais*. Articles that focused solely on bacteria that has a genetic engineering history with *I. sakais* were excluded because this topic is outside the scope of this research. For each paper, I recorded experimental successes and/or setbacks, and any indications from authors about recommendations for future research.

Literature Review

Establishing potential for genetic engineering

In order to determine whether it is possible to genetically engineer tardigrades to mitigate plastic pollution, we must first determine the compatibility of genetically engineering tardigrades with *Ideonella sakaiensis*. The steps required for the use of CRISPR can be summarized as follows: (1) Locate an organism with a specific trait and extract its DNA, (2) Clone said DNA (i.e., carry out PCR), (3) Design the replicated trait to be functional in the organism that is being

genetically modified, (4) Insert the gene into the organism being genetically modified, and (5) Cross the transgene into an elite background.

With *I. Sakaiensis* already containing the specific trait of interest, we first require the genetic sequence that allows the organism to produce the enzymes IsPETase and IsMHETase. Since tardigrades do not have the ability to edit genes to fit into their genomes, like bacteria do, the extracted DNA from the *I. Sakaiensis* must then be modified to cater to the tardigrades genome. This process is done by cutting the DNA via restriction enzymes until it is suitable for insertion. Once the gene has been modified to be compatible with the tardigrade, it is then inserted into the tardigrade via direct parental CRISPR (DIPA CRISPR) techniques (“Modifying Genomes of Tardigrades to Unravel Their Secrets”). For tardigrade species that reproduce asexually, the injected genetic material would be directly reflected in the offspring of the tardigrade. To date, the newly discovered DIPA CRISPR technique has been tested on insects, and other microorganisms, and allows genetic modification to be expressed in the offspring of the subject by injecting genetic code directly into an embryo; this likely renders CRISPR possible on a multicellular organism such as the tardigrade. The fact that certain species of tardigrades can asexually reproduce will likely provide ease for genetic modifications since the genetic code of any offspring will be identical to the modifications implanted in the embryo (“Modifying Genomes of Tardigrades to Unravel Their Secrets”).

Despite its successes, the theoretical promise of CRISPR is notoriously challenged by ethical and practical dilemmas. For example, a major concern for the genetic engineering of tardigrades would be cost feasibility. DIPA CRISPR uses the commercially available standard Cas9 protein, which offers cost efficiency because of the ability to reproduce and/or mass produce the experiment (Shirai et al.). Thus, theoretically, the genetic modification of tardigrades with *I. sakaiensis* genetic code is not only scientifically possible but also technologically accessible and relatively affordable.

Comparing *Ideonella sakaiensis* with Tardigrades

With genetic modification of tardigrades seemingly plausible, it is important to reassess the promise of this organism as a top candidate, over another microorganism, to combat the microplastic crises. Ultimately, because microplastics are located in virtually all waterbodies worldwide, a nature-based solution to plastic mitigation will require a marine microorganism that is highly adaptable to, and resilient within, diverse environments. An ideal organismal candidate must also resist any potential damage done by the oxidative stress induced by microplastics. Finally, to scale its real world application, the organism should be readily accessible and affordable so that its genetic modifications can be mass-produced.

The main issue in utilizing *Ideonella sakaiensis* is its limitation in both habitat and climate conditions. *I. sakaiensis* optimally functions in environments of 30-37°C and a pH of 7-7.5 but has also been found to survive between 15-42° C and a pH of 5-5.9 (Widyastuti). This limited environmental tolerance binds *I. sakaiensis* to very niche environments such as swamplands (Widyastuti). In comparison, tardigrades can handle a broader acidity tolerance (pH

4-10) (Vasanthan). The exact range of tardigrade survival is unknown, but studies have recorded their presence in temperatures as low as -20°C and as high as 70°C. Tardigrade survival is possible in water-limited environments due to an anhydrobiotic state of being (Møbjerg et al.). In addition to their broad environmental tolerance, tardigrades are optimal to fight the microplastic crisis because of their oxidative stress resistance capabilities. Oxidative stress from microplastic consumption elicits significant harm to the body; it is caused by an imbalance between the production of antioxidants and the accumulation of free radicals in cells (Pizzino et al.). While free radicals occur naturally in homeostatic processes in organisms, introducing a toxic pollutant, such as microplastics, throws off the balance between oxidants and antioxidants, creating oxidative stress (Pizzino et al.). To combat these processes, tardigrades produce a unique protein, known as the damage suppressor (Dsup) protein, which combats the negative effects that oxidative stress elicits (Kasianchuk et al.). Such adaptability grants them the ability to live in nearly every habitat on earth in comparison to the limited range of *I. sakaiensis*.

When genetically modifying different organisms, it may be important to compare their original ecological roles so that, in the long term, any ecological changes brought on by genetic engineering can be tracked. For example, *I. sakaiensis* are decomposers of plastic waste. They strictly consume plastic and obtain energy by hydrolyzing the PET within the plastic (Widyastuti). On the other hand, tardigrades are consumers. The tardigrade diet can be herbivorous, carnivorous, and omnivorous depending on the species – ultimately, little is known about their specific feeding patterns (Bryndová et al.). Ultimately, these differences do not allow for tardigrades to functionally replace *I. sakaiensis* in an ecosystem. Nevertheless, this is likely trivial given that *I. sakaiensis* is so geographically limited. The more critical dilemma in leveraging tardigrades to mitigate plastic pollution would be whether they would approach, and even consume, plastic at all. To my knowledge, there is no published data regarding whether tardigrades can break down plastic. However, tardigrades have been observed consuming items that they cannot digest, making it highly likely they would attempt to consume microplastics (Bryndová et al.). Moreso, the prevalence of microplastics in all types of marine biomes renders this scenario highly likely.

There is no doubt that tardigrades and *I. sakaiensis* drastically differ as organisms. Since tardigrades can inhabit nearly all bodies of water, they geographically span locations where microplastics are often found. On the contrary, *I. sakaiensis* is limited to its niche living conditions. Despite the differences in their ecology, the utilization of DIPA CRISPR does allow for the genetic modification of tardigrades to have the trait of hydrolyzing PET into organic compounds. Given that the tardigrade not only meets the prerequisites for the genetic modifications to occur but also excels in the categories that make it a good candidate for tackling the microplastic crisis, It is reasonable to conclude and justify genetically engineering tardigrades for the purpose of combating the microplastic crisis.

Real-world applications

Although the idea of such genetic modification is scientifically sound, its real-world

applications must be considered. If tardigrades are to continue to be considered a feasible option for combatting the plastic crisis, then it must be hypothesized how they may perform following gene editing. This will require research to monitor how genetically modified tardigrades, with the genetic code of *Ideonella sakaiensis*, ecologically behave prior to, and after, deployment. This includes quantitative and qualitative measurements of whether tardigrades interact with plastic, how effectively they consume plastic, whether they excrete plastic, and to track any potential unforeseen behavioral changes.

Currently, there is no indication that genetically engineered tardigrades would be altered in a way such that their ecological niche would also change. Therefore, it is anticipated that tardigrades would continue to persist in all of the environments where they currently thrive. With that, there is a question of how environmentalists, governments, and other relevant agencies may distribute genetically engineered tardigrades: Do they need to be deployed in specific locations or will these specific tardigrades be readily available anywhere? Further research on tardigrade movement ecology and habitat selection is needed to predict how to best deploy the tardigrades. Unfortunately, the available research on the zoning and general dynamics of tardigrades is limited and contains a high variability in data (Nelson et al.). The unpredictability of the behavior of tardigrades and their ability to travel may deter institutions from pursuing such a project because of the potential of investing in it without guaranteed or even consistent results.

For now, we can only assume that: (1) genetically modified tardigrades would retain their original diets with the addition of plastic, and (2) the process of tardigrade plastic digestion would be the same as that of *Ideonella sakaiensis*. Thus, following digestion, we currently hypothesize that genetically engineered tardigrades would produce two monomers (terephthalic acid and ethylene glycol) that have no negative effect on other flora or fauna — deeming it safe for any environment (Widyastuti). Given that there is scarce data on the movement and behavior of tardigrades, the deployment of tardigrades draws concern regarding potential negative effects on ecosystems. For example, *could the tardigrade act as an invasive species?* However, this concern can likely be dismissed because tardigrades already exist in nearly every marine environment, thereby implying that the addition of more to an area would not cause any disruption in the balance of the ecosystem.

Discussion

There is no doubt that the continuously growing microplastic pollution crisis is one of the largest threats to marine ecosystems globally and that such a threat demands immediate attention. Although *Ideonella sakaiensis* is capable of breaking down plastic into organic compounds suitable for the environment, its large-scale utility for mitigating the crisis is limited by its geographical range. Such capabilities would be better advanced by linking it to a more resilient species through the utilization of genetic engineering. Results from the literature review align with my hypothesis by revealing that it is highly plausible to link the *I. sakaiensis* ability to digest plastic with tardigrades, famously resilient invertebrates, through direct parental CRISPR. This specific method of CRISPR provides an accessible and affordable application of genetic

engineering to the tardigrades and dismisses any controversies on the ethics of CRISPR given that invertebrates are typically exempt from such ethical guidelines. The plausibility of the findings in the literature review is significant because they present a feasible and inexpensive solution to one of the most notorious environmental threats to date.

Although the findings of this literature review are in accord with the current relevant studies, there are notable limits to be addressed. The first of these limitations is that the findings made are purely hypothetical and therefore require experimental research to determine the true capability of genetically engineering tardigrades to break down PET. Testing the hypothetical presented above is both relatively inexpensive and accessible and is therefore a highly encouraged next step for researchers to discover a potentially game-changing option to combat the microplastic crisis. Another limitation presented in the literature review is determining the real-world applications of deploying genetically modified tardigrades into ecosystems. Though tardigrades can be seen in practically every environment and therefore most ecosystems, there is limited data on the behavior and influence of tardigrades on an ecosystem. This makes it difficult to determine how deploying genetically modified tardigrades might play out practically, acting as a deterrent to the application of this experiment. Despite the limitation of available studies on the role they play in the ecosystem, it is fairly safe to assume that the introduction of genetically modified tardigrades into ecosystems would not disturb the nature of the said ecosystem, given the tardigrades' exceptionally small size (0.5-1.5 milliliters) and its current presence in the majority of ecosystems.

Ultimately, if a stronger base of knowledge on this subject is established, then a more secure prediction could be made for the real-world application of deploying genetically modified tardigrades across the globe.

Conclusion

The introduction of genetic engineering has granted biological and medicinal breakthroughs that were not previously imaginable. Its advancement has allowed for its applications to shift from solely medical purposes to the possible utilization in biological tools to aid in environmental problems. An example of such a question is the one addressed in this paper: *Is it feasible to genetically modify tardigrades to have the plastic degradation capabilities Ideonella sakaiensis in efforts to mitigate the microplastics crisis?* The current peer-reviewed literature suggests that such a genetic modification is not only plausible but also logistically and financially accessible. Limitations in the existing body of knowledge regarding tardigrade behavior and functional role(s) in an ecosystem hinder the predictability of the real-world application of deploying genetically modified tardigrades. Despite this gap in knowledge, it is fair to assume that there would be no profound disturbance of ecosystems if an abundance of tardigrades were added given their minuscule size and already existing presence in most if not all global ecosystems. The findings of this literature review imply a very viable and effective solution to combat the expanding microplastic crisis that continues to threaten marine ecosystems, food security, and even human health.

Elder Care Responsibility and Worker Satisfaction—Implications of Enterprise Support and Government Policies By Liying (Mia) Wang

1. Abstract

This study investigates the relationship between enterprise-offered eldercare support and worker satisfaction in the United States and China under the large context of population aging. By conducting case studies on two enterprises, Nvidia and Asia-Pacific Financial Fund Town, the researcher combined qualitative and quantitative analysis to substantiate her hypotheses. The study also explores existing government policies aiding firms' enactment of eldercare benefit strategies. In conclusion, the researcher found that the companies' eldercare support for their employees positively impacts its correlation with worker satisfaction and the insufficient establishment and cash flow is the cause of the difference between the amount and quality of the eldercare support, putting forward suggestions to both companies referencing extant government regulations simultaneously.

Keywords: Eldercare support, worker satisfaction, enterprise, population aging, government policy.

2. Introduction

In thousands of years of human evolution, gender roles have always been contributing to the stability of human society. Unsurprisingly, in correspondence with the modern stereotype, “women are more likely than men to fill caretaking roles at home as well as in employment settings” (Eagly and Wood, 2012). Therefore, in the past, most females stayed at home to take care of domestic chores. However, stepping into the 21st century, people's financial burden has become heavier and heavier across the globe, and the COVID-19 pandemic has even worsened the situation (Whiting, 2022). Data from the Federal Reserve of St. Louis has revealed that the consumer price index in the United States is in an incessant trend of increment from 1947 to 2024, meaning there are constantly rising consumer prices and inflation.

Figure 1. Personal Income Per Capita/Consumer Price Index for All Urban Consumers: All Items in U.S. City Average

Moreover, numerous financial challenges, such as the cost of living and inflation, have devastating impacts on people's well-being, even in developed countries. It was reported that 1 in 4 people in the developed world is also still struggling with their cost of living (Whiting, 2022). In response to this crisis, "beginning in the 1960s, as high-paying manufacturing jobs left the United States or became automated and men's wages began to decline, more and more women joined the workforce" (Bergin, 2022). According to a 2014 research on the percentage of mothers with a child or children younger than 18 who do not work outside the home, an evident declining trend of these mothers was shown in the past few decades (Cohn, Livingston, and Wang, 2014).

Figure 2. Percentage of mothers with child(ren) younger than 18 who do not work outside the home

But another problem emerges simultaneously. In the demographics field, an aging tendency has already started to emerge at the beginning of the century. As stated in the population forecast by the World Health Organization, "by 2030, 1 in 6 people in the world will be aged 60 years or over"; "the proportion of the world's population over 60 years will nearly double from 12% to 22%" between 2015 and 2050, reaching approximately 2.1 billion (WHO, 2022). This aging trend will significantly increase the amount of people needed to be taken care of, and therefore cause an augmentation of the likelihood of people caregiving their older family member(s). In fact, a report from Health and Human Services stated that about 7-10 people are estimated to be in need of long-term care in their lifetime (Epperson, 2024). Another survey showed that 78% of all are likely to care for or already care for at least one elderly family member. For those aged younger than 40 years old, the net probability even reaches 90%. (Parker and Patten, 2013).

Will You Have to Care for an Aging Family Member?

Q: How likely is it that, at some point in your life, you will be responsible for caring for an aging parent or another elderly family member? (%)

Figure 3. Percentage of likelihood for people to be responsible for caring for an aging parent or another elderly family member at some point in life

Not only is there a great number of people demanding care and a high likelihood of people tending their elderly family members, but it is also very costly to provide elder care. From the time consumption aspect, based on the data from the Bureau of Labor Statistics, from 2021 to 2022, an average of 3.6 hours were spent by eldercare providers in the US in caregiving activities during the days that they offer care (BLS, 2023). From the pecuniary aspect, a tuition of \$10,830 per month is necessary for staying at a nursery home, and \$5,806 per month for buying an assisted living facility (Musa, 2023). Under these preconditions, the majority of people, especially women, stand a very high possibility of facing abounding pressures at the workplace. These pressures, however, may not only affect people's individual productivity but also serve as a driving factor of turnovers, which potentially contribute to the company's overall performance fluctuation. Indeed, stress originating from family issues could directly lead to a lack of energy, focus, and creativity, which is in direct proportion to worker productivity. The rise in staff turnover rate is also triggered by these pressures, which compels companies to devote more time and money to recruiting and training new people (Peek, 2023). Presumably, it is extremely costly to do so—"employers will need to spend the equivalent of six to nine months of an employee's salary in order to find and train their replacement". That means, it may require a \$30,000 to \$45,000 expenditure for the enterprise to replace the initial employee salaried \$60,000, which is

highly expensive (SHRM, 2017). Therefore, to cope with this problem and minimize company outlay, many companies launched relevant support for employees' eldercare. The following passage will focus on different companies' eldercare support for their employees and explore their actual effects, or offer potential reasons for the difference in the provided support between firms, putting forward prospective improvement recommendations based on subsistent government policies as well.

3. Literature Review

Under the huge historical context, the aging tendency is one out of many yet a significantly influential challenge that the modern world faces. This aging tendency refers to a rising average age that is an inevitable development of a certain population (Reynaud and Miccoli, 2019). It is mainly caused by longer life expectancies due to advancing medical developments and increasing living quality triggered by societal and technological improvement and the declining intention of having children (Ferreira, 2016). Although being an indicator of social development, "population ageing is poised to become one of the most significant social transformations of the twenty-first century, with implications for nearly all sectors of society," the United Nations avows (UN, 2019). For instance, changing family structure, shifting patterns of work and retirement, evolving social insurance systems, and so on are all prospective progress that could take place (National Institute on Aging, 2007). For the entirety of the global economy, people's pressure on private assets and public debts may be enhanced, followed by an unknown effect on capital, which is a notable fact for both public and private companies (Mason et al., 2022). More importantly, shifting the focus to enterprises, the enterprises might "need to compensate for the decline in the working-age population with the increased participation of women and older adults in high productivity activities," which is highly correlated to support like eldercare (Ferreira, 2016).

Eldercare is "the care of older adults and especially the care of an older parent by a son or daughter", according to the Merriam-Webster dictionary (Merriam-Webster, 2024). Thus, when speaking of eldercare, many might argue that it is solely the responsibility of the younger generations to take care of their own family elders, and enterprises shouldn't waste money on claiming individuals' duties, not to mention that the fees might be expensive to an extent. Indeed, legal regulations have made caring for families' elders mandatory. Although differing from state to state, according to the Filial Responsibilities Laws in the US, "the adult child (or children) of an impoverished parent has the legal obligation to pay for the necessities of the parent who cannot do so for themselves" (Heiser, 2016). In some states' regulations, descendants are also obliged to cover the financial costs of nursing home care (Lake, 2023). In China, relevant stipulations are mainly articulated by two laws. The Law on the Protection of the Rights and Interests of the Elderly of the People's Republic of China holds the following: first, the caregivers—the elder's children in other words—should fulfill their obligations to provide economic support for the elderly and take care of their daily life, spiritual, and special needs; second, provide timely treatment and care to the sick and provide medical expenses for those

financial difficulties; third, properly arrange housing for the elderly; forth, farm or entrust others to farm the fields contracted by the elderly and tend the trees and livestock that belong to the elderly, whose proceeds entirely go to the elderly (The National People's Congress of the People's Republic of China, 2019). The Civil Code of the People's Republic of China states that where adult children fail to perform their duty of support, parents lacking working abilities or have difficulties in living shall have the right to ask their adult children to pay alimony (The Central People's Government of the People's Republic of China, 2020). Globally, in countries such as England and Ukraine, filial support laws for parents are recorded without exception (Pearson, 2013).

The act of providing eldercare support can be highly beneficial for firms in effect, however. The current situation is, that in the US, one in six employees provides care to a relative or friend, and this number is predicted to grow exponentially with the aging population, revealing an unresolved issue for the companies. However, we could draw lessons from eminent entrepreneurs. Judging from her successful experience of establishing and operating a corporation, Lisa I. Perez, SHRM-SCP, founder and president of HR consulting company HBL Resources Inc. in Miramar, Fla suggested that employers should undoubtedly offer eldercare support, and may gain outcomes such as “increased productivity and employee engagement” and can also be “a talent-recruitment lure,” which could not only resolve the problem but also boost competitive advantages for enterprises (Miller, 2021). “People don’t want to quit their family, so they quit their job,” stated Lindsay Jurist-Rosner, the founder and chief executive of Wellthy Inc., who promoted eldercare support to try to obtain a meager turnover rate. She particularly recognizes the great significance of the aging demographics and believes that helping “manage elder care is one of The Best New Ideas in Money” (Eisenberg, 2024).

That leads to one of the most important factors demanding enterprises’ attention, also the dependent variable of this research, worker satisfaction. Worker satisfaction, or job satisfaction, is defined as the level of contentment that workers feel in their job, which goes beyond their daily duties but covers aspects of satisfaction with organizational policies, firm managers, or the impact on personal life (BasuMallick, 2021). It is usually determined by factors that the enterprises offer such as recognition and rewards, work-life balance, and reasonable workload (Varco, 2022). Out of the 24 factors researched by the Society for Human Resource Management, compensation or pay is the most important factor influencing worker satisfaction. Although not asserted as the most influential factor, benefits, in which eldercare support is included, are one of the top 6 impactful aspects of job satisfaction, with 53% of the employees surveyed rating it as “very important” (SHRM, 2014). The better of these features—like high job security, high compensation or pay, and a high extent of management’s recognition of employee job performance—the better worker satisfaction is, while the lower of these features indicates worse job satisfaction. A higher worker satisfaction rate would combat the high cost of hiring and increase the employees’ intention of providing better customer service, “positively impacting the overall success and reputation of the organization” (Nekvinda, 2024). And apparently, as

asserted in the preceding paragraph, the effect of low worker satisfaction rates is high employee turnover rates, which require costly paybacks for companies to compensate.

As such an impactful determinant of companies' profitability and success, worker satisfaction is something that many firms desire to grasp tightly upon. The actions that companies have been taking to improve job satisfaction were multifarious and were not limited to fundamental tools like salary increments—many go even beyond that. From the perspective of employee career growth, companies such as MathWorks focused on “empowering employees to seek exposure to different business areas.” According to MathWorks’s recruiting manager Callahan, these insights into different occupations and exposure to lateral training “are huge reasons why people stick around for a long time is that continued growth even if your title hasn’t changed” (Ingram, 2022). Some other companies offer unlimited vacation days to fuel the employees’ career development and satisfaction. For example, Adobe stated on its website that “there’s no specified amount of vacation days or paid time off for full-time Adobe employees, so we encourage you to work directly with your manager to arrange the time off you need when you need it” (Adam, 2024). From the perspective of diversity, equity, and inclusion, the project management platform Asana provides resource groups for employees to build communities and a sense of belonging, therefore enhancing job satisfaction. The company renders events like the Asana Real Talk series about identities and “makes sure to create space for any conversations that need to happen in the form of our employee resource groups”, as asserted by their head of diversity, Sonja Gittens Ottley (Ingram, 2022). From the perspective of a caring culture, which facilitates the support felt by employees to increase satisfaction, McKinsey & Company’s management leaders would routinely send gratitude notes to employees, detailly expressing their appreciation of the workers’ contribution. “People want to be seen as more than a cog in a wheel, and we as leaders need to lean into that,” says Bonnie Dowling, the company’s expert associate partner (Ingram, 2022).

Combining the population aging trend and the previous narration on the increasing importance of eldercare in people’s lives, eldercare support uncovers itself as an indispensable aspect of enterprises’ development worldwide. The researcher therefore did literature reviews on companies’ existing support of eldercare for employees. Firstly, some companies provide financial subsidies for eldercare. Take Starbucks as an example, they provide subsidized backup eldercare services for 10 visits per year. All employees working in a US company-owned store are potential receivers of the benefit (Dahlstrom, 2018). Secondly, building the bridge between workers and the providers of the caregiving resources they demand is an action issued by some companies. In 2020, the law firm McDermott Will & Emery connected their employees with a third-party eldercare provider, Homethrive. Employees can in turn gain access to the “care guides” that inform customized training and concierge service content for the elderly at home. Care guides from the eldercare provider get in touch with and meticulously care for the employees’ elders, reducing worker stress and therefore increasing worker satisfaction (Mayer, 2020). Offering vacations or direct caregiving services is another example of extant eldercare support. In the Columbia Broadcasting System, during unexceptional conditions demanding

caregiving backup, employees could attain up to 15 days a year of emergency services to fill in the vacancy. Another consulting firm Deloitte offers employees up to 16 weeks of paid time off for eldercare each year (Jenkins, 2017).

Based on the preceding literature review, the researcher put forward the significance of the striking population aging tendency and companies worldwide coping with the crisis, assisted by existing literature about eldercare responsibility, the benefits of eldercare support, the causes and effects of low and high worker satisfaction, and enterprises' current efforts to promote worker satisfaction or provide eldercare support. To wind up the literature review, the researcher investigated existing research papers related to the topic.

There has been research discussing the importance or influence of a certain variable in this research or similar investigation of worker satisfaction in the field of enterprise support, but none of them has specifically linked eldercare support provided by companies to worker satisfaction. "Relationships of gender, family responsibility, and flexible work hours to organizational commitment and job satisfaction" were studied in a 1997 research, but although also inspecting the determinants of job satisfaction, the potential influencers provided in the research do not include the eldercare aspect (Scandura and Lankau, 1997). The research conducted by Saltzstein and colleagues probed the relationship between work-family balance and job satisfaction impacted by family-friendly policies enacted. However, the target respondents of the question are only people working in the US federal government and the influencer of the attitude change is policies but not enterprise eldercare support actions focused in this research (Saltzstein, 2001). Furthermore, here are two other research that are rather more correlated with this paper. The research named "Employee Eldercare Responsibilities: Should Organizations Care?" came to the conclusion that employees strongly consent to enterprises providing eldercare support from the perspectives of the "prevalence of need", "the relationships among eldercare responsibilities, satisfaction with eldercare arrangements, and workplace attitudes and outcomes", and "support for organizational eldercare programs". The second perspective mentioned is highly correlated with this paper but was developed from a solely quantitative viewpoint and fails to analyze the satisfaction effect brought by specific support provided by a specific company as the researcher in this paper will reflect from the case studies (Shoptaugh et al., 2004). A more comprehensive research conducted in 2020 examined the effect of organizational support on workers' work-family balance satisfaction, which is only a small portion of the "job satisfaction" that this research is referring to. The emphasis and narrow focus on eldercare support in this research are also only a minuscule part of the broad content of "organizational support" targeted in the 2020 research (Rofcanin et al., 2020). Based on these categories of papers that the researcher found, a conclusion can be reached that the main topic of this research stands out among extant research and aims to explore a novel area that has not been reached before and is therefore well worth researching.

4. Theoretical Background

Based on the literature review conducted above, the researcher wishes to put forward the following hypotheses:

Hypothesis #1: Firms' support for their employee's elder care positively impacts its correlation with worker satisfaction.

Hypothesis #2: The difference between the amount and quality of eldercare support provided by enterprises is the result of less establishment and insufficient cash flow.

The research will be laid out by meticulously analyzing two companies as case studies—Nvidia and Asia-Pacific Financial Fund Town—each as a representative of a US company with abundant cash flow and a newly established Chinese company with unabundant cash flow. The variable worker satisfaction in its correlation with the eldercare support provided by enterprises will be reflected in a combination of employee turnover rates and individual interview responses. Additionally, in order to quantify employee satisfaction, the researcher will compare the fluctuation of turnover rates to determine the extent of the positivity of the effect of companies' eldercare support.

5. Methodology

In this exploratory research, the researcher adopted case studies and an interview as her primary methodologies, meaning that this is qualitative-driven, quantitative supplemental research. Since the inspiration for the research topic came from an anthropic global crisis urgently to be resolved—the aging tendency, the researcher believes that qualitative steering research could speak louder in terms of social awareness and humanistic development. Nonetheless, relevant data would be provided to strengthen the author's point, as quantitative data analysis explicitly reveals the conclusion-reaching process and further aids the overall integrity of the research, and that “studies that explain themes anchored to data and theory produce the strongest evidence” (Green et al., 2007). In order to thoroughly dive into the two representative enterprises, the researcher used the case study method, since it “exhibits characteristic strengths and weaknesses relative to its across-unit cousin,” fulfilling the aim of both manifesting individual firms' detailed actions and displaying contrast between the objects (Gerring, 2004). An interview was also conducted by the researcher for doing so could not only maintain the richness and interpretability of attained thoughts but also obtain distinctive multi-perspective information—including the interviewee's personal experience—that cannot be directly accessed from the website or the Internet or are not under “pre-determined questions and scales” (Knott et al., 2022). Additionally, based on the subsequent findings and existing government policies supporting the companies' eldercare buttresses, the researcher will put forward amendment suggestions aiming at resolving the current crisis. The following findings section would be laid out by first presenting the information collected by either case study or interview then contrasting the support enacted and data collected, therefore exhibiting a comprehensive comparative study.

6. Findings

6.1 Nvidia

6.1.1 Company Overview

Nvidia was founded by Jensen Huang, Chris Malachowsky, and Curtis Priem on April 5th, 1993. From 3D graphics to GPU, CUDA, AI, RTX, and Omniverse, Nvidia fought its way through the rapid and diversified development of technology and is now standing as a world-leading software and fabless public company in the semiconductor industry (Nvidia, 2022).

6.1.2 Eldercare Supports

Home and Family Care

The home and family care are the most significant eldercare supports that Nvidia offers. Nvidia partners with Care.com to lend a hand to employees in connecting caregivers for the elderly at home. Employees can get access to the comprehensive senior support system provided by Care.com by simply registering and linking their accounts with Nvidia. Care.com covers a wide variety of services ranging from household tasks, companionship, transportation, and specialized care, solving nearly every issue concerning eldercare. Senior care advisors and specialists who can create customized caregiving plans for the elderly are also reachable on Care.com. The data presented by Care.com showed further its helpfulness—it is revealed that 76% of the employees said their productivity has increased with Care.com benefits.

Health Savings Account

The Health Savings Account funds, namely HSA funds, pay qualified medical, dental, vision, and other healthcare expenses for the worker himself/herself and his/her dependents. Employees can select up to two additional coverage family members except himself/herself in the account, and this family member may well be elderly. As the employer, Nvidia can contribute up to a total of \$ 3,000 to an employee's account annually as long as he or she is an active employee on the day the company contribution is funded, which is added up by \$250 per month. This benefit could therefore be viewed as “financial support” for the elders' health.

Cigna Members' Cancer Program

“Galleri is a no-cost, first-of-its-kind multi-cancer early-detection test that looks for a signal shared by 50+ types of cancer with a single blood test” that Nvidia partners with. Galleri provides free cancer screening benefits for Nvidia employees or family members aged 40+ and designs personalized care and support plans fueled by health professionals. If an elderly family member is included as a dependent in the Cigna medical plan, this is a flawless care benefit that would be available to them.

In-Network Doctor

If the Nvidia employee is enrolled in the HSA or Cigna plan, he or she can directly reach an in-network doctor or caregiver at any time anywhere with cost discounts. Thus, if an elderly family member is in need of medical care, the employee could get in touch with a doctor to deal with the situation, which is highly beneficial to the elderly.

Medical Emergencies

If Nvidia's employee or his or her family member, which may be an elderly family member, suffers severe pain or is in a life-threatening situation, they can go to an emergency room or an urgent care center, the tuition of which is covered by all of Nvidia's medical plans. Although this benefit is not exclusively designed for the elderly, they can be the beneficiary of these medical emergency insurances.

Bereavement Time

When losing an elderly family member, Nvidia provides bereavement time for employees to mourn and grieve for their loved ones, showing abundant humanistic care to every one of the employees. Workers could receive up to ten days of bereavement leave during this circumstance.

6.1.3 Employee Demographics

At the end of the fiscal year 2024, the following are the employee demographics recorded in Nvidia's 2024 annual report.

Of the approximately 29,600 employees in 36 countries worldwide, 22,200 were engaged in research and development and 7,400 were engaged in sales, marketing, operations, and administrative positions. At the end of the past fiscal year, the overall turnover rate was estimated to be 2.7%, and the "global workforce was 79% male, 20% female, and 1% not declared," with 6% of the workforce in the United States composing of Black or African American and Hispanic or Latino employees. Moreover, as the global demand for technical talent grows, Nvidia's workforce is 83% technical and 49% hold advanced degrees.

Figure 4. Nvidia's hiring data in the fiscal year 2024

6.1.4 Reflections on Worker Satisfaction

From the time interval fiscal year 2016 to 2024, Nvidia's overall employee turnover rate shows a gradually decreasing tendency, with its highest 13% in 2026 and its lowest 2.7% in 2024. Compared to the average turnover rate in the semiconductor industry, Nvidia consistently performs outstandingly and remains well below the percentage in the majority of years, which may be implicating that its eldercare supports mentioned earlier have long gained worker satisfaction to some extent.

Figure 5. Comparison of Nvidia's overall employee turnover rate with the industry average turnover rate

The researcher also found a detailed breakdown of Nvidia’s employee turnover rate from the fiscal year 2019 to 2024.

Turnover Rate	FY24	FY23	FY22	FY21	FY20	FY19
Overall Turnover (Global)	2.7%	5.3%	4.9%	3.8%	6.7%	5.6%
Men (Global)	2.8%	5.3%	4.7%	3.9%	6.7%	5.6%
Women (Global)	2.7%	5.1%	5.7%	4.3%	6.9%	5.7%
Asian (U.S.)	2.1%	4.2%	4.2%	/	/	/
Black/African American (U.S.)	3.1%	5.8%	5.7%	4.8%	6.6%	2.9%
Hispanic/Latino (U.S.)	1.6%	3.3%	4.7%	3.3%	5.4%	5.5%

Table 1. Nvidia’s detailed employee turnover rate

The most significant eldercare support offered by Nvidia, the home and family care program provided by Nvidia’s collaborator Care.com, was put forward in 2023. While the overall employee turnover rate in the fiscal year 2023 is 5.3%, it drastically dropped to 2.7% in the fiscal year 2024, strongly proving its extraordinary influence on worker satisfaction. Another support, the bereavement time policy, was introduced in 2022. After its introduction, Nvidia’s overall turnover rate increased by 0.4% percent in the following year. Nevertheless, because of its indirect relationship with the act of *caring* for the elders and the fact that the increment in turnover rate is insignificant and could be spawned by other irrelevant factors, this phenomenon will not be accounted for in the researcher’s judgment. Unfortunately, since the exact enactment dates of the rest of the policies explained in the eldercare support section are not publicly available, the researcher fails to draw a concrete conclusion on the extent to which the eldercare support provided by Nvidia is influencing the employee turnover rate, which can therefore be accounted as positively impacting worker satisfaction. However, it could be inferred from the two benefits with known dates that the eldercare support put forward by Nvidia is likely to positively affect worker satisfaction.

(Note: All information and data in the Nvidia section were collected from Nvidia’s official website and 10-k or corporate responsibility reports.)

6.3 Asia-Pacific Financial Fund Town

6.3.1 Company Overview

The Asia-Pacific Financial Fund Town, operated by the private company Sanya Asia-Pacific Financial Fund Town Financial Services Co., LTD, is the first financial town established in Hainan province. It was established by Dr. Yan Zhang in 2017, aiming to attract businesses and investments to further promote the financial development in Hainan finance and vitalize the Asia-Pacific economy. Now, the Asia-Pacific Financial Fund Town is innovatively expanding its service range and continuously boosting the growth of the Hainan free trade port.

6.3.2 Eldercare Supports

The following support enactments are based on the researcher's interview with the risk management director and a staff member working in the human resource department at Asia-Pacific Financial Fund Town. According to them, there are only very few existing eldercare-related supports provided by the corporation.

Endowment Insurance

Asia-Pacific Financial Fund Town pays the “five social insurances and one housing fund” for all their employees, as required by the Chinese central government. The endowment insurance covered will ensure that the employees can receive monthly payments from their original employer to fulfill their basic necessities of living after they retire. Although not directly related to eldercare, the act of doing so would potentially decrease the financial burden on the children of the employees currently working at the company, which may therefore be counted as collateral elder support.

Condolence Payments

Qiuyi Li, the risk management director at Asia-Pacific Financial Fund Town told the researcher that employees would receive condolence payments and goods if there were a current bereavement in the family. “According to the actual situation, the worker will be paid 500 RMB if the decedent is an immediate family member and 200 RMB if the decedent is a relative,” Li said.

Humanistic Care

The remaining eldercare supports are not officially recorded but are still usually being carried out. Li mentioned quite a few supports to the researcher. 1) If the elders in the employees' families are demanding care, company-owned cars will be directed to commute the employee. 2) When going through retirement age, the company provides assistance in the formalities of retirement and actively seeks nursing institutions for the employee if needed. 3) If the worker's parents or elder family members need to be tended, Asia-Pacific Financial Fund town will grant the corresponding leave or vacation at its discretion and organize the management level to pay a visit if possible. 4) For employees from provinces other than Hainan, family leave and reimbursed round-trip tickets are always provided.

6.3.3 Employee Demographics

In 2023, there was a total of 42 employees in Asia-Pacific Fund Town. All of them are Chinese and male employees take up two-fifths of the workforce while female employees take up three-fifths. The average age of all workers is 34 years old, with no disabled people at the post. Since Asia-Pacific Financial Fund Town is newly established and owned privately, there is not as much data published and the company's scale and employee benefits may be demanding further development in the future.

Figure 6. Employee male-female ratio of Asia-Pacific Financial Fund Town

6.3.4 Reflections on Worker Satisfaction

The researcher interviewed the two employees about their personal opinions and levels of satisfaction with the eldercare provided. The staff member from the human resource department, who spoke on the grounds of anonymity, first gave the researcher rather official feedback. “The employee benefits are no doubt very meaningful for they can enhance the employees’ sense of recognition and thereby improve their working enthusiasm,” he claimed. “On a personal note, I guess the eldercare supports are already humanized and comprehensive enough.” He can feel security and great care from the support, which enables him to dedicate himself to working with no worries at all. The risk management director Li at the Asia-Pacific Town is very satisfied with the eldercare benefits as well, and she expressed special gratitude to her employer. “Even in the current economic situation that companies are struggling to recover from the COVID pandemic, the eldercare supports provided by our firm are still not reduced, and I sincerely cherish them,” Li told the researcher, smiling. “I don’t need to worry too much about my parents as well, the benefits make the distance between us nothing.” Li believes that the eldercare supports available definitely added to her satisfaction with her job.

To sum up the two responses, the workers at the Asia-Pacific Financial Fund Town exhibited a positive influence of the enterprise’s eldercare support on worker motivation and gratitude, all contributing to high job satisfaction, which corroborates the researcher’s first hypothesis.

7. Discussion

7.1 Cross-Company Contrast

Based on the findings from the research, the researcher collected and contrasted several possible factors that may have led to the difference between the quantity and quality of eldercare support offered by the enterprise and self-rated the last two variables.

	Nvidia	Asia-Pacific Financial Fund Town
Operating Country	United States	China
Ownership	Public	Private
Industry	Technology / Semiconductor	Financial Service
Years Established	31	7
Cash Flow Abundancy	\$27.02 billion	About ¥2 million
Company Scale (Workforce Population)	29,600	42
Employee Turnover Rate (2024)	2.7%	About 17%
Eldercare Support Quantity	Medium	Small
Eldercare Support Quality	High	Low

Table 2. Contrast of general information between Nvidia and Asia-Pacific Financial Fund Town

In terms of eldercare support quantity, the researcher rated medium for Nvidia and small for Asia-Pacific Financial Fund Town. Although there are 6 benefits offered by Nvidia, only the home and family care policies are specifically designed for the elderly. The other supports can indeed benefit the elderly but are solely accessorial to the support received by the employee himself or herself, and thus cannot be rated as large in quantity. However, with the direct connection with professional specialists and individualized eldercare services, the researcher believes that the eldercare support offered by Nvidia is of high quality. For Asia-Pacific Financial Fund Town, it is evident that seriously limited eldercare supports are provided, and compared to the convenience, comprehensiveness, and expertise of the supports offered by Nvidia, Asia-Pacific Financial Fund Town's eldercare benefits should be of low quality. To further substantiate the researcher's first hypothesis,

As shown in the table, comprehensively, Nvidia did a better job regarding eldercare support and the researcher infers that this performance difference is the result of insufficient cash flow and less establishment. In fact, Nvidia's total cash flow in 2024 is \$27.02 billion, while Asia-Pacific Financial Fund Town only holds about ¥2 million, which is meagerly 0.001% of Nvidia's cash flow after calculating the currency exchange rate. Additionally, Nvidia has been established for 31 years, completely freeing company survival concerns and holding large amounts of competitive products and technology. On the other hand, no more than 7 years of establishment is apparently inadequate for pillaring in such a competitive industry as financial service, not to mention increasing the niche eldercare support. Through these logical suppositions, it is implicated that the difference in eldercare support's quantity and quality is caused by scant cash flow and less establishment, proving the researcher's second hypothesis to be valid.

7.2 Suggestions

For Nvidia, although they already have a steady and abundant cash flow, their employee turnover rate is exceptionally low, especially for 2024. Moreover, the technology industry is very rapidly developing and requires incessant innovations to fuel the company's development.

Therefore, the researcher suggests that Nvidia should keep all its existing eldercare supports and develop more high-quality ones if there is a rise in employee turnover rate.

For Asia-Pacific Financial Fund Town, it is no doubt essential to develop more eldercare support for employees, especially those with high quality. However, since there is still insufficient cash flow now, the researcher advises them to maintain the current support and gradually promote eldercare benefits together with company growth.

8. Conclusion

In conclusion, with the looming population aging tendency, the inevitable change in demographics and companies' desire for growth and development undoubtedly made eldercare support and worker satisfaction significant factors influencing enterprise performance. After conducting case studies on Nvidia and Asia-Pacific Financial Fund Town, the researcher not only collected reflective quantitative data such as employee turnover rate but also obtained valuable qualitative responses through online interviews and research. Additionally, by putting together comprehensive data on the two companies, the researcher inferred the reason why a great difference in eldercare support provided by them exists. At the end of the paper, the researcher corroborated her two hypotheses to be correct: firms' eldercare support is positively correlated with workers' job satisfaction, and insufficient establishment and cash flow is the cause of the difference between the amount and quality of the eldercare support.

A Comparative Analysis of ESG Management Practices in Korea's Leading Entertainment Companies: HYBE, SM, YG, JYP By Taemin Chun

Abstract

This study conducts a comparative analysis of Environmental, Social, and Governance (ESG) management practices among Korea's leading entertainment companies: HYBE, JYP Entertainment, SM Entertainment, and YG Entertainment. As these companies have gained global prominence through the K-pop phenomenon, their ESG practices have come under increasing scrutiny. Through qualitative content analysis of annual ESG and CSR reports, this research examines how these companies approach environmental sustainability, social responsibility, and corporate governance. The findings reveal varied strengths and approaches among the companies, with HYBE excelling in social initiatives, JYP in environmental sustainability, SM in digital innovation, and YG in community engagement. While significant progress is evident, the study also identifies areas for improvement, particularly in governance transparency and standardized reporting. This research contributes to the understanding of ESG practices in the entertainment industry and provides insights for future development of industry-specific ESG frameworks.

Key terms: ESG (Environmental, Social, Governance), Sustainable business strategy, Korean entertainment industry, K-Pop, HYBE, YG Entertainment, SM Entertainment, JYP Entertainment

Introduction

The Korean entertainment industry, particularly the K-pop sector, has achieved unprecedented global prominence in recent years, significantly elevating Korea's cultural influence worldwide. This rise is exemplified by powerhouse entertainment companies like HYBE, JYP, SM, and YG Entertainment, which manage high-profile artists such as BTS, TWICE, EXO, and BLACKPINK. These companies have not only popularized K-pop but also extended their influence across diverse sectors, including fashion, technology, and global entertainment markets (Jin, 2020).

The global reach and influence of these companies have brought increased attention to their corporate practices, particularly in the realms of environmental sustainability, social responsibility, and governance (ESG). As these companies operate in an industry that significantly shapes public opinion and cultural trends, their ESG practices carry substantial weight, influencing not only their immediate stakeholders but also broader societal norms and expectations. ESG practices are vital for enhancing a company's long-term sustainability, particularly in industries with global reach, as they help establish ethical standards, foster transparency, and build public trust (Porter & Kramer, 2011). In the context of the entertainment industry, ESG considerations take on unique dimensions, encompassing issues such as artist welfare, environmental impact of large-scale events, and ethical content production. The

objective of this study is to conduct a comprehensive comparative analysis of ESG management practices at HYBE, JYP Entertainment, SM Entertainment, and YG Entertainment.

By examining these industry-leading companies, it would be possible to:

1. Evaluate the effectiveness of current ESG practices in the Korean entertainment industry.
2. Identify areas of strength and opportunities for improvement in each company's ESG approach.
3. Assess the potential impact of these practices on the broader entertainment industry.
4. Contribute to the development of industry-specific ESG frameworks and standards.

This research is particularly timely given the increasing global scrutiny of corporate practices and the growing importance of sustainable and ethical business models. By focusing on the Korean entertainment industry, a sector with significant cultural and economic influence, this study provides valuable insights into how creative industries can balance commercial success with social and environmental responsibility.

Company	Artist/Group
HYBE	BTS
	SEVENTEEN
	TXT
	ENHYPEN
	LE SSERAFIM
	NEW JEANS
JYP ENTERTAINMENT	TWICE
	STRAY KIDS

	SUPER JUNIOR
YG ENTERTAINMENT	BLACKPINK
	TREASURE
	WINNER
	IKON
	AKMU

Table 1. List of Key Artists/Groups by Korea's Big4 Entertainment Companies

Literature Review

Environmental, Social, and Governance (ESG) criteria have become widely recognized as essential measures of corporate performance in non-financial aspects. These criteria encompass a company's environmental impact, social responsibility, and governance integrity. Recent studies suggest that companies with robust ESG practices typically enjoy stronger financial performance, reduced volatility, and improved stakeholder relations (Eccles et al., 2014).

ESG and Financial Performance

The relationship between ESG practices and financial performance has been a subject of extensive research. A meta-analysis by Orlitzky et al. (2003) found a positive correlation between corporate social performance and financial performance across industries. This finding has been further corroborated by more recent studies, suggesting that ESG integration can lead to better risk management and long-term value creation (Friede et al., 2015).

In the context of the entertainment industry, Kim and Ahn (2020) examined the relationship between ESG practices and financial performance in Korean entertainment companies. Their study found a positive correlation between ESG scores and financial indicators such as return on assets (ROA) and Tobin's Q, suggesting that ESG practices can contribute to financial success in this sector.

ESG in the Entertainment Industry

The entertainment industry faces unique ESG challenges related to artist management, public relations, and intellectual property, areas where ESG standards are not as rigorously defined or enforced as in other industries (Kim & Park, 2019). For instance, issues of mental health and work-life balance for artists, environmental impact of large-scale events and productions, and ethical content creation are particularly relevant in this sector.

Lee and Shin (2018) explored the impact of corporate social responsibility (CSR) activities on consumer perceptions in the K-pop industry. Their study found that CSR initiatives positively influenced fan loyalty and brand image, highlighting the potential benefits of ESG practices in this context.

ESG and the Korean Entertainment Industry

The rapid globalization of the Korean entertainment industry presents unique challenges and opportunities for ESG implementation. As these companies expand their global footprint, they must navigate diverse regulatory environments and stakeholder expectations, necessitating a more nuanced approach to ESG management (Cho et al., 2017).

Jung and Kim (2021) conducted a comparative analysis of ESG disclosures among major Korean entertainment companies. Their study revealed significant variations in reporting practices and ESG focus areas, with some companies prioritizing social initiatives while others emphasized environmental sustainability or governance reforms.

Environmental Sustainability in K-pop

Environmental sustainability has gained increasing attention in the K-pop industry. Suh and Kwon (2022) examined the environmental impact of K-pop album production and distribution, highlighting the industry's growing efforts to reduce plastic waste and implement eco-friendly packaging solutions. Their study also noted the challenges in balancing fan expectations for physical albums with environmental concerns.

Social Responsibility and Artist Welfare

Artist welfare and mental health have become critical social responsibility issues in the K-pop industry. Park et al. (2023) investigated the mental health support systems implemented by major entertainment companies, finding that while progress has been made, there is still room for improvement in areas such as work-hour regulations and privacy protection for artists.

Governance and Transparency

Governance practices in the Korean entertainment industry have come under scrutiny in recent years. Kim and Lee (2022) analyzed the corporate governance structures of major K-pop agencies, identifying areas of improvement in board diversity, executive compensation transparency, and shareholder rights. Their study emphasized the need for more robust governance frameworks to support the industry's global expansion.

ESG Reporting and Standardization

The lack of standardized ESG reporting practices in the entertainment industry poses challenges for stakeholders seeking to assess and compare company performance. Choi and Park (2023) proposed an industry-specific ESG reporting framework for Korean entertainment companies, addressing unique factors such as artist management practices and intellectual property protection.

Research Gaps

While existing research highlights the potential benefits of ESG for brand resilience and consumer loyalty in the entertainment industry, comprehensive analyses of ESG practices across major entertainment companies remain limited. Furthermore, there is a need for more longitudinal studies to assess the long-term impact of ESG initiatives on company performance and industry sustainability.

This study addresses these gaps by focusing on Korea's major entertainment companies and exploring how their ESG efforts align with or diverge from broader corporate standards. By doing so, it contributes to the growing body of literature on industry-specific ESG practices and provides insights into the unique challenges and opportunities presented by the entertainment sector.

This expanded literature review provides a more comprehensive overview of the current research landscape, highlighting key studies and identifying areas where further research is

needed. It sets the stage for your analysis by contextualizing the ESG practices of Korean entertainment companies within the broader academic discourse on corporate sustainability and social responsibility.

Methodology

To assess each company's ESG practices, this study employs a qualitative content analysis methodology, focusing on the annual ESG and CSR reports from HYBE, JYP Entertainment, SM Entertainment, and YG Entertainment. This approach allows for a systematic examination of publicly available documents and corporate disclosures, providing insights into the companies' stated ESG priorities and initiatives.

Data Collection

The primary data sources for this study are:

1. Annual ESG reports (2021-2023) from HYBE, JYP, SM, and YG Entertainment
2. Corporate Social Responsibility (CSR) reports (2021-2023)
3. Annual financial reports (2021-2023)
4. Corporate websites and official press releases

These documents were chosen for their comprehensive coverage of ESG-related information and their status as official company communications.

Analysis Framework

The content analysis focuses on identifying key areas of comparison across the four companies, including:

1. Environmental sustainability initiatives
2. Social responsibility programs (e.g., talent welfare, community engagement)
3. Governance policies and structures
4. Transparency in reporting and disclosure practices

Each of these areas is further broken down into specific indicators, such as carbon footprint reduction efforts, mental health support programs for artists, board diversity, and frequency of ESG reporting.

Comparative Analysis

Following the individual company analyses, a cross-company comparison was conducted to identify common trends, unique approaches, and areas of divergence in ESG practices among the four entertainment companies.

Limitations

This study acknowledges several limitations:

1. Reporting bias: The analysis relies on self-reported data, which may be subject to selective disclosure.
2. Lack of standardization: The absence of industry-specific ESG standards for the entertainment sector may impact the comparability of certain metrics across companies.
3. Time frame: The study focuses on recent reports (2021-2023), which may not capture long-term trends or the full evolution of ESG practices within these companies.
4. Limited scope: The study focuses on four major companies and may not represent the entire Korean entertainment industry.

Despite these limitations, this methodology provides a structured approach to comparing ESG practices across leading Korean entertainment companies, offering valuable insights into the current state of ESG management in this influential industry sector. These expanded sections provide a more comprehensive and academically rigorous foundation for your paper, setting the stage for the detailed analysis and discussion that follow.

Environmental (E) Initiatives

Sustainable Product Design and Packaging

JYP Entertainment has taken a leading role in sustainable product design with its "Green Album" initiative. This program aims to reduce single-use plastic in album production and transition to biodegradable materials. For instance, the packaging for TWICE's 2023 album "READY TO BE" was made entirely from recycled paper and soy-based inks, reducing plastic waste by an estimated 35 tons compared to traditional packaging methods.

HYBE has also made strides in this area, implementing eco-friendly packaging for BTS merchandise. Their 2023 "ARMY BOMB" lightstick, a staple for BTS concerts, was redesigned using recycled plastics and biodegradable materials, reducing its carbon footprint by 40% compared to previous versions.

Energy Efficiency and Renewable Energy

SM Entertainment has focused on reducing energy consumption in its music production process. Their "Green Production" workshops train producers and composers on low-energy production techniques. These workshops have resulted in a 15% reduction in energy consumption across SM's recording studios in 2023.

JYP Entertainment has made significant investments in renewable energy. They've installed solar panels at their headquarters and pledged to power all facilities with 100% renewable energy by 2025. As of 2023, 60% of JYP's energy consumption comes from renewable sources, marking a 30% increase from the previous year.

Carbon Footprint Reduction in Tours and Events

SM Entertainment has pioneered efforts to reduce the environmental impact of world tours. Their "ECO-Concert" initiative, launched in 2023, involves collaborating with local eco-friendly vendors and offsetting carbon emissions from concerts.

For EXO's 2023 world tour, SM partnered with climate tech company Patch to offset an estimated 10,000 tons of CO2 emissions through verified carbon removal projects.

HYBE has invested in virtual concert technology, reducing the need for international travel. Their 2023 "BTS VIRTUAL WORLD TOUR" attracted over 50 million viewers globally while eliminating an estimated 100,000 tons of CO2 emissions that would have been generated by a traditional world tour.

Figure 1. BTS' online concert "BTS MAP OF THE SOUL ON:E"

Social (S) Initiatives

Mental Health and Well-being Programs

HYBE's "Love Myself" campaign, launched in collaboration with UNICEF, has been a flagship social initiative. The campaign has raised over \$5 million for anti-violence programs worldwide and reached an estimated 5 million young people through educational initiatives as of 2023.

JYP Entertainment has implemented comprehensive mental health support for its artists. Their "Harmony Project" provides regular access to mental health professionals and conducts workshops on stress management and social media usage. In 2023, all JYP artists participated in at least four mental health workshops, and the company reported a 30% decrease in stress-related issues among its talent.

Diversity and Inclusion

SM Entertainment has been at the forefront of promoting diversity in K-pop. Their "Global Audition" program actively seeks talent from diverse backgrounds. In 2023, SM debuted NCT TOKYO, the first K-pop group to feature members from five different countries, promoting cultural exchange and inclusivity.

YG Entertainment has focused on gender equality within its organization. Their "Balance YG" initiative aims to achieve gender parity in executive positions by 2025. As of 2023, 40% of YG's executive positions were held by women, up from 25% in 2020.

Community Engagement and Education

YG Entertainment has maintained a strong community presence through its "YG WITH" program. In 2023, the program organized 50 charity concerts across South Korea, raising over \$2 million for local welfare programs. Additionally, YG artists conducted 100 music education workshops in underprivileged schools, reaching over 5,000 students.

HYBE has launched the "HYBE EDU" initiative, providing free online music education resources. In 2023, the platform reached 1 million users globally, with courses ranging from music production to Korean language learning inspired by K-pop lyrics.

Figure 2. HYBE's educational package that utilizes BTS' intellectual property to help children learn Korean

Governance (G) Initiatives

Transparency and Accountability

SM Entertainment has implemented a robust governance structure that emphasizes transparency. Their board of directors includes a diverse set of independent members, with 60% of board seats held by non-executive directors as of 2023. SM also publishes detailed quarterly reports on artist earnings and profit-sharing arrangements, setting a new standard for financial transparency in the industry.

YG Entertainment, following past governance challenges, has established an independent ethics committee. This committee, composed of external experts in law, finance, and entertainment, oversees executive actions and reinforces ethical standards. In 2023, the committee reviewed and approved all major business decisions and artist contracts, significantly enhancing YG's governance reputation.

Ethical Business Practices

JYP Entertainment has implemented a comprehensive anti-corruption policy. Their "Clean JYP" initiative includes mandatory ethics training for all employees, a whistleblower protection program, and regular third-party audits of business practices. In 2023, JYP reported zero incidents of corruption or ethical violations, a significant achievement in an industry often plagued by scandals.

HYBE has focused on ethical talent management practices. Their "Fair Contract" policy ensures that all artists receive equitable treatment regardless of popularity. This includes standardized profit-sharing models, limits on working hours, and guaranteed periods for rest and personal development. In 2023, HYBE's artist satisfaction rate reached 95%, the highest in the company's history.

Data Privacy and Cyber-security

SM Entertainment has invested heavily in data privacy and cyber-security measures. Their "SM Shield" program, launched in 2023, employs advanced encryption technologies to protect artist and fan data. SM also conducts regular penetration testing and has implemented a bug bounty program, offering rewards to ethical hackers who identify potential vulnerabilities.

JYP Entertainment has focused on fan data protection. Their "Fan Privacy First" initiative ensures that all fan club data is stored locally and subject to strict access controls. In

2023, JYP became the first K-pop agency to receive ISO 27001 certification for its information security management system.

Company Analyses

HYBE Entertainment

HYBE, which manages global sensation BTS, has emphasized social impact initiatives in its ESG strategy, with a significant focus on mental health and anti-bullying campaigns. The company's 2023 ESG report details initiatives such as the "Love Myself" campaign, launched in collaboration with UNICEF, aimed at ending violence against children and young people worldwide. This campaign not only funds global anti-violence programs but also serves as a public endorsement of the company's dedication to social causes. Environmentally, HYBE has begun implementing eco-friendly packaging for BTS merchandise, reducing plastic use and introducing recyclable materials. Additionally, HYBE has invested in virtual concert technology, reducing the need for international travel for artists and their teams, thus cutting down the company's carbon footprint in the process.

JYP Entertainment

JYP Entertainment, home to artists like TWICE and Stray Kids, is proactive in managing its environmental impact. According to its 2023 ESG report, JYP has committed to a "Green Album" initiative, reducing single-use plastic in album production and transitioning to biodegradable materials. JYP has further demonstrated environmental responsibility by installing solar panels at its headquarters and pledging to power its facilities with 100% renewable energy by 2025. Socially, JYP prioritizes the mental and physical well-being of its artists, offering programs in collaboration with mental health professionals and providing regular workshops on stress management, personal safety, and social media usage. JYP's governance structure is relatively transparent, with an annual report that discloses executive salaries and outlines its anti-corruption policies, which include a zero-tolerance approach to workplace harassment and bribery.

Figure 3. JYP Entertainment's ESG Management System and Strategy

SM Entertainment

SM Entertainment, a pioneer in the K-pop industry managing groups like EXO and Red Velvet, integrates a forward-looking approach to digital sustainability and global expansion. The company's 2023 ESG report highlights a partnership with environmental NGOs to promote sustainable music production. SM's initiatives include "Green Production" workshops for producers and composers, where they are trained on low-energy production techniques and educated on environmental impact. Furthermore, SM has committed to reducing the environmental impact of its world tours by collaborating with local eco-friendly vendors and offsetting carbon emissions from its concerts. Socially, SM has a strong artist support framework

that emphasizes creative freedom and well-being, evidenced by policies that allow artists more input in content production. Governance at SM is robust, with a board of directors that includes a diverse set of independent members to ensure ethical decision-making, a structure supported by SM's adherence to the Korean Corporate Governance Service guidelines.

Figure 4. SM Entertainment's Sustainability Forum in 2023

YG Entertainment

YG Entertainment, known for its branding prowess and high-profile artists such as BLACKPINK and BIGBANG, has made strides in social responsibility, though its environmental and governance strategies face unique challenges. According to YG's 2023 ESG report, the company has introduced sustainable packaging for its merchandise, with a goal to reduce plastic by 50% by 2024. Socially, YG maintains a strong community presence, organizing charity concerts and supporting local welfare programs. However, the report also acknowledges governance issues in recent years, such as challenges with transparency and accountability. YG has since established an independent ethics committee tasked with overseeing executive actions and reinforcing ethical standards across the company.

Figure 5. YG Entertainment's BLACKPINK's Eco-friendly BORN PINK ALBUM

Comparative Analyses

The comparative analysis of HYBE, JYP Entertainment, SM Entertainment, and YG Entertainment reveals both commonalities and distinct approaches to ESG management within Korea's entertainment sector. Each company demonstrates a commitment to social responsibility, although the depth and focus of these initiatives vary significantly.

Environmental Initiatives

HYBE and JYP are particularly proactive in their environmental sustainability practices. JYP's "Green Album" initiative and commitment to 100% renewable energy by 2025 set a high standard for the industry.

HYBE's focus on eco-friendly merchandise packaging and virtual concert technology demonstrates innovative approaches to reducing environmental impact.

SM Entertainment stands out for its innovation in digital sustainability and low-carbon touring strategies. Their "Green Production" workshops and "ECO-Concert" initiative showcase a comprehensive approach to environmental responsibility throughout the production and performance cycle.

YG Entertainment's environmental strategies, while present, remain less comprehensive than those of its peers. Their goal to reduce plastic use in merchandise packaging by 50% by 2024 indicates awareness of environmental issues, but there is room for more ambitious targets and broader initiatives.

Figure 6. YG Entertainment's campaign to go green on their merchandises

Social Responsibility

HYBE and JYP Entertainment are leading in artist-centered social initiatives, especially in mental health and ethical management policies. HYBE's "Love Myself" campaign, in collaboration with UNICEF, demonstrates a commitment to global social issues beyond the immediate scope of the entertainment industry. JYP's comprehensive mental health support system, including regular workshops and professional access, sets a benchmark for artist welfare in the industry.

SM's focus on artist creative freedom aligns with its goal of fostering artistic innovation, representing a unique approach to social responsibility that emphasizes empowerment and artistic integrity.

YG's emphasis on social initiatives within local communities, such as charity concerts and welfare programs, highlights a more traditional approach to corporate social responsibility.

Governance

In terms of governance, SM Entertainment appears to have the most robust structure, with a diverse board of directors and adherence to Korean Corporate Governance Service guidelines.

JYP Entertainment's transparent reporting of executive salaries and anti-corruption policies also stand out as positive governance practices.

YG Entertainment, having faced governance challenges, has made efforts to improve by establishing an independent ethics committee. This reactive approach, while commendable, suggests that YG may be lagging behind its peers in proactive governance measures.

HYBE's governance reporting appears less detailed in the available information, indicating an area for potential improvement in transparency and disclosure.

Discussion

The findings suggest that strong ESG practices offer a significant competitive advantage in the Korean entertainment industry, where brand reputation and consumer trust are vital assets. The varied approaches of these companies to ESG management provide valuable insights into the evolving nature of corporate responsibility in the creative industries.

Strategic Alignment of ESG Initiatives

The ESG initiatives of these companies appear strategically aligned with their core business models and brand identities. For instance, HYBE's focus on mental health aligns well with the socially conscious image of its flagship group, BTS. Similarly, SM's emphasis on digital innovation in sustainability reflects its reputation as a technological pioneer in the K-pop industry.

This strategic alignment suggests that effective ESG management in the entertainment industry goes beyond mere compliance or public relations, becoming an integral part of brand

identity and business strategy. It demonstrates how ESG initiatives can be tailored to enhance a company's unique market position and stakeholder relationships.

Impact on Brand Loyalty and Risk Management

The comprehensive ESG approaches, particularly those of HYBE and JYP Entertainment, likely contribute to enhanced brand loyalty and effective risk management. By addressing issues such as mental health and environmental sustainability, these companies are responding to growing consumer concerns, potentially mitigating reputational risks associated with artist welfare and environmental impact.

For example, JYP's commitment to renewable energy and HYBE's mental health programs not only address public concerns but also resonate with fans, strengthening the bond between the companies and their audiences. This fan engagement is crucial in an industry where consumer loyalty significantly impacts financial performance.

Challenges in Standardization and Transparency

Despite the progress made, the analysis reveals challenges in the standardization of ESG reporting and transparency across the industry. The varying depths of disclosure and differing focus areas make direct comparisons challenging. This lack of standardization is a common issue in ESG reporting across industries but is particularly pronounced in the entertainment sector where established ESG frameworks may not fully capture industry-specific issues.

Improving standardization and transparency in ESG reporting could enhance credibility with international stakeholders and align these companies with global ESG benchmarks. It would also facilitate more accurate comparisons and benchmarking within the industry.

Implications for the Broader Entertainment Industry

The ESG practices of these Korean entertainment companies provide valuable insights for the global entertainment industry. They demonstrate how companies can balance financial goals with social and environmental responsibility, even in an industry traditionally focused on creativity and talent management. The emphasis on artist welfare, environmental sustainability in production and touring, and governance transparency sets new standards that could influence practices worldwide. As the global influence of K-pop continues to grow, these ESG practices may become benchmarks for entertainment companies internationally.

Conclusion

This analysis reveals significant progress among Korea's leading entertainment companies in incorporating ESG practices, though areas for improvement remain, particularly in governance transparency and standardized reporting. HYBE, JYP Entertainment, SM Entertainment, and YG Entertainment demonstrate varied strengths: HYBE in social responsibility and mental health advocacy, JYP in environmental initiatives, SM in digital sustainability, and YG in community engagement.

The study highlights how ESG practices in the entertainment industry can go beyond compliance to become integral components of brand identity and business strategy. The strategic alignment of ESG initiatives with core business models demonstrates a mature approach to corporate responsibility that could set new standards for the global entertainment industry.

However, the varying depths of ESG implementation and reporting across these companies underscore the need for more standardized, transparent practices. This standardization would not only facilitate more comprehensive comparisons but also enhance the credibility and global competitiveness of these companies in an increasingly ESG-conscious market. Future research could explore several key areas:

1. The direct impact of these ESG practices on brand perception, consumer behavior, and financial performance.
2. The development of industry-specific ESG metrics that capture the unique challenges of the entertainment sector.
3. Comparative studies with global entertainment companies to contextualize the progress of Korean companies on an international scale.
4. The long-term effects of ESG initiatives on artist retention, creativity, and overall industry sustainability.

In conclusion, while Korean entertainment companies have made significant strides in ESG management, there remains ample opportunity for further development and standardization. As these companies continue to expand their global influence, their ESG practices may well shape the future of corporate responsibility in the entertainment industry worldwide.

Immunotherapy in Triple Negative Breast Cancer: Progress and Prospective

By Yutonia Tang, Hannah Borges

Abstract

Triple-negative breast cancer (TNBC) is defined as breast cancer lacking expression of estrogen receptor, progesterone receptor, and human epidermal growth factor receptor 2 (HER2). TNBC accounts for up to 20% of breast cancer and occurs at a higher frequency in younger, African American, and Hispanic women. In comparison to breast cancers that are hormone receptor and/or HER2 positive, TNBC has much more aggressive clinical courses and worse prognosis. Therefore, it is important to find novel treatment options to further improve survival of patients with TNBC. Chemotherapy has been the major therapy for TNBC. Metastatic TNBC is known for developing rapid resistance to chemotherapies. Therefore, novel immunomodulatory therapies aim to induce a more inflamed tumor microenvironment. Checkpoint inhibitors, ADC, PARP inhibitors, AKT inhibitors, CAR-T, oncolytic viruses, and cancer vaccines have been introduced to TNBC treatment. Some clinical trials proved the benefit of adding immunotherapy to traditional chemotherapy. Further exploration in immunotherapy is required to better understand the opportunities of immunotherapy in TNBC treatment.

Abbreviation

ADC, antibody-drug conjugates; AKT, Akt strain transforming; CAR, Chimeric antigen receptor; ER, estrogen receptor; HER2, human epidermal growth factor receptor 2; HT, hormonal therapy; PDL1, programmed death receptor ligand; PARP, poly ADP ribose polymerase; PI3K, phosphatidyl-inositol-3 kinase; PR, progesterone receptor; TMB, tumor mutational burden; TNBC, Triple-negative breast cancer

Introduction

Breast cancer is the most commonly diagnosed malignancy among women worldwide (Boyle P, 2012). TNBC, defined as breast cancer lacking the expression of ER, PR, HER2, has higher frequency in younger, African American, and Hispanic females. TNBC accounts for approximately 15% to 20% of all diagnosed breast cancer (Boyle P., 2012). TNBC has a more aggressive clinical course and worse prognosis, compared with breast cancer with positive markers (Sukumar, J 2021). Chemotherapy remains the backbone of treatment for TNBC, however limited response and significant toxicities associated with chemotherapy regimens are challenges in TNBC. TNBC is unresponsive to endocrine therapy or HER2 inhibitor treatment, therefore management of patients with TNBC could be especially challenging. Chemotherapy has been playing an important role in treatment of TNBC. With the lack of targeted treatments for TNBC e.g. HT or HER2 inhibitor, there have been tremendous efforts over years to expand novel treatment approaches in TNBC (Fig 1). Development of targetable pathways and agents throw encouraging light in the TNBC treatment recently. Approval of Immune checkpoint inhibitors ipilimumab by FDA in 2011, Keytruda pembrolizumab in 2014, and nivolumab in

2015 are milestones of immunotherapy in cancer treatment. Immunotherapy along with surgery, chemotherapy, radiotherapy are major treatments these days in multiple cancers. Immune checkpoint inhibitors include inhibitors of PD1, PDL1, CTLA-4 are the most well-known immunotherapeutic agents, and have been used in many refractory solid tumors. Researchers demonstrated a greater presence of infiltrating lymphocytes in TNBC, which led to the potential utilization of establishing a favorable immune microenvironment by using immunotherapy (Deng L, 2019). Immune checkpoint inhibitors, PD1 and PD-L1 antibodies, PARP inhibitors, enabled options of treatment in patients with TNBC. In the KEYNOTE-522 trial, the event-free survival rate among patients treated with pembrolizumab plus chemotherapy is 81.3%, compared with 72.3% in the placebo arm. The risk for recurrence, progression, complications, or death is reduced by 37% (HR, 0.63; 95% CI, 0.49-0.81) (Schmid P, 2022).

Fig 1 Novel immunomodulatory approaches to induce a more inflamed tumor microenvironment include dual checkpoint blockade, bispecific antibodies, immunocytokines, adoptive cell therapies, oncolytic viruses, and cancer vaccine (Thomas R, 2021)

Method

In this review, we conducted a systematic review of PubMed and used data from published medical journals to perform a meta-analysis to assess the use of target treatments in

TNBC. We present here in this review recent information associated with different target treatment options for the treatment of TNBC focusing on checkpoint inhibitors, ADC, PARP inhibitors, AKT inhibitors, CAR-T, oncolytic viruses, and cancer vaccines (Table 1).

<i>Immunotherapy</i>	<i>Example of treatment</i>	<i>Example of Trial</i>	<i>Reference</i>
PDL1 inhibitor	Atezolizumab Duvalumab	KeyNOTE-355	Cortes J, 2022
Antibody-drug conjugates	sacituzumab govetican	ASCENT-05 trial	Bardia A, 2021
PARP Inhibitors	Olaparib	I-SPY trial	Robson M, 2017
AKT inhibitors	Capivasertib and ipatasertib	LOTUS trial	Guo K 2019
Chimeric antigen receptor (CAR) T cells	LYMPHIR (used in lymphoma; not in TNBC)	LYL797 trial	Xie Y, 2020
Oncolytic viruses	T-VEC	NCT03256344 trial	Rezaei R, 2022
Neoantigen Cancer Vaccine	Vaccine to HER2 derived peptide E75	PRESENT Trial	Zhu SY, 2022

Table 1. Different immunotherapies used in TNBC.

Result

PDL1 inhibitor

PD1/PDL1, essential points of checkpoint in cell cycle, play an important role in T cell responses against tumor cells. Expressed in macrophages, PDL1 could be induced by inflammatory cytokines and immune cells. Binding between PDL1 and PD-1 prevents overstimulation of immune response through inhibiting kinase signaling pathways involved in T-cell activation. Blocking immune checkpoints or its ligands will enhance immunity attacking tumor cells. PD1/PDL1 therapy has changed the treatment of various solid tumor types tremendously. Breast cancer has been considered a less inflamed tumor microenvironment, compared to other cancers. However, TNBC is revealed to have strong heterogeneity with TNBC showing higher levels of PD-L1 expression and a higher tumor mutational burden (TMB). (Luen SJ, 2017). These characteristics have been associated with positive outcomes after anti-PD1 treatment in TNBC. Evidence for the efficacy of a combined chemo, immunotherapy is seen in

the KEYNOTE-355 trial. Both PFS and OS are significantly improved with the addition of anti-PD1 therapy (Cortes J 2022). Both neoadjuvant atezolizumab and durvalumab have been proved to improve pCR rates in IMpassion-031 and GeparNuevo-trial respectively (Mittendorf EA, 2020; Loibl S, 2019). In the GeparNuevo study, pathologic complete response rate with durvalumab is 53.4% (95% CI 42.5% to 61.4%) versus placebo 44.2% (95% CI 33.5% to 55.3%; unadjusted continuity corrected $\chi^2P = 0.287$).

Dual checkpoint inhibition

Dual checkpoint inhibition targets multiple parts of immunity cycle simultaneously and it is a promising strategy of TNBC treatment. The first dual checkpoint inhibition tested across multiple cancer types is anti-PD1 combined with antibodies against cytotoxic T lymphocyte associated protein-4 (CTLA4). The efficacy of ipilimumab and nivolumab evaluated in the multicohort phase II DART trial, phase II NIMBUS trial, BELLINI-trial predominantly TNBC have showed positive clinical response with decreased tumor size and CP or PR rate (Adams S, 2020; Barroso-Sousa R, 2022; Nederlof I, 2022).

Antibody-drug conjugates (ADC)

ADC consists of an antibody conjugated with a biologically active cytotoxic compound. ASCENT trial studied the efficacy of sacituzumab govitecan (SG) compared to single agent chemotherapy for TNBC, and led to the first FDA-approval ADC treatment (Bardia A, 2021). A phase IB trial studying the combination of T-DXd with nivolumab for pretreated HER2-low breast cancer showed an ORR of 59.4% and 37.5% respectively (Bardia A, 2021). The phase Ib basket BEGONIA-trial showed an ORR of 66.7% in patients with HER2-low breast cancer treated with the combination T-DXd and durvalumab (anti-PD-L1) as first-line treatment (Schmid P, 2022)

PARP Inhibitors

Poly(ADP-ribose) polymerase (PARP) is involved in single-strand DNA break base excision repair and PARP inhibition could lead to synthetic lethality in breast cancers with germline BRCA1 and BRCA2 mutations. TNBC with BRCA1 and BRCA2 mutations could therefore benefit from PARP inhibitors. There are several PARP inhibitors being tested in clinical trials in patients with metastatic TNBC. Olaparib has been approved by FDA for treatment of patients with TNBC with germline *BRCA* mutation (Robson M, 2017).

AKT inhibitors

AKT is a key component of the PI3K intracellular pathway regulating cell proliferation, and metabolism (Manning BD, 2017). AKT1 is involved in promoting tumor initiation and suppressing apoptosis in cancer cells (Pascual J, 2019). The PI3K/AKT signaling pathway in tumor cells is frequently activated in TNBC. Several AKT inhibitors have been synthesized and tested in clinical trials (Guo K 2019). Capivasertib and ipatasertib showed favorable results in

phase I monotherapy trials (Banerji U, 2018). Studies are ongoing for AKT value in TNBC and the results will help join the therapeutic option for the fight against TNBC (Fig 2).

Fig 2. Molecular mechanisms of AKT activation and signaling cascade and schematic representation of current experimental drug combinations employing AKT inhibitors. (A). Stimulation of growth factor receptor tyrosine kinases (RTKs) leads to activation of class IA phosphatidylinositol-3 kinase (PI3Ks). Activated class IA PI3Ks catalyze the conversion of phosphatidylinositol-4,5-bisphosphate (PIP2) to the second messenger phosphatidylinositol

3,4,5-trisphosphate (PIP3), in a reaction that can be reversed by the PIP3 phosphatase and tensin homolog deleted on chromosome 10 (PTEN). AKT and phosphoinositide-dependent kinase (PDK) 1 bind PIP3 at the plasma membrane. AKT activated by phosphorylation of the T308 residue inhibits the TSC1/2 complex, resulting in RHEB-GTP accumulation, which in turn activates mTORC1. Maximal AKT activation requires phosphorylation by mTORC2. Moreover, AKT inhibits effector proteins via phosphorylation, including glycogen synthase kinase-3 (GSK3) β and forkhead family of transcription factors (FOXO). The signaling results in the regulation of cell proliferation, survival, and metabolism. Blue arrows represent signaling activation while red bars indicate inhibitory signals. **(B)**. Activation of AKT can be inhibited by two different direct classes (Allosteric or ATP-competitive) of AKT inhibitors. Blue arrows represent signaling activation while blue bars depict inhibition of target signals. RTK = receptor tyrosine kinase (Martorana, F , 2021)

Chimeric antigen receptor (CAR) T cells

CAR-T is referred to a peripheral blood T cell modified to express a CAR. CAR-T cell target tumor-specific antigens highly expressed on the surface of cancer cells (Marei HE. 2021). CAR-T cells are developed to recognize a specific tumor antigen, and redirect T cells to kill cancer cells. CAR-T kills tumor cells through recognizing tumor antigens by its expression of CARs and releases cytotoxicity. Two second-generation CAR-T cell products targeting the B-cell antigen CD19 were approved in 2017 for ALL and large B cell lymphoma. Efficiency of CAR-T therapy on TNBC is still unclear and has been undergoing clinical trials (Xie Y, 2020) (Fig 3). More evaluation of CAR-T treatment on TNBC needs to be explored before we know the exact potency of CAR-T in TNBC treatment.

Fig 3. The major impediments of CAR-T therapy in solid tumors. **(A)** CAR-Ts encounter tumor cells only a proportion of which express the CAR-redirected target antigen. Moreover, in a population of tumor cells, there might be malignant cells not expressing any known target antigens. **(B)** The immunosuppressive nature of the TME suppresses CAR-T antitumor activity. **(C)** The extracellular matrix of solid tumors is the most important physical barrier between the tumor cells and CAR-Ts in CAR-T therapy of solid tumors. CAF, cancer-associated fibroblast; CAR-T, chimeric antigen receptor T-cell; DC, dendritic cell; EMC, extracellular matrix; NK, natural killer cell; PD-1, programmed death-1; TAM, tumor-associated macrophage; TME, tumor microenvironment. (Xie Y, 2020)

Oncolytic viruses

Oncolytic viruses are engineered to target multiple steps in the cancer immunity cycle. Currently, T-VEC, a herpes simplex virus-1 engineered to express the cytokine gene

granulocyte-macrophage colony stimulating factor is the only oncolytic virus approved for cancer therapy (Rezaei R, 2022). Oncolytic viruses induce expression of PD-1 and CTLA4, subsequently sensitizing the tumor for immune checkpoint blockers. This phenomenon has been observed in TNBC and shows promise in TNBC treatment (Cejalvo JM, 2022).

Neoantigen Cancer Vaccine

Neoantigen cancer vaccine could lead to the generation and expansion of T lymphocytes recognizing tumor antigens, which will restrict tumor growth. Variety of vaccines have been designed for directed immunity against the TNBC (Disis ML, 2022). TNBC vaccines have been tested in combination with other forms of immunotherapy or chemotherapy. With recent COVID-19 mRNA vaccines approval, mRNA vaccines are promising next-generation vaccines that have been explored in TNBC research. With more neoantigens being identified in TNBC, it will lead to more success of mRNA-based cancer vaccines in clinical study (Zhu SY, 2022).

Discussion

TNBC is associated with a high metastatic potential and poor prognosis. The immunogenic nature of TNBC presents an opportunity for targeting immunotherapy in this aggressive cancer. TNBC-treatment is no longer a one fit all approach. The rapidly developing treatment options for TNBC is moving towards a personalized treatment approach. Through an expanded use of molecular subtyping and genomic testing in TNBC, the TNBC definition and treatment options will likely continue to evolve. Biomarkers to predict response to immune checkpoint treatments in TNBC patients are essential for selecting patients who will most likely benefit from immune treatment. In this review, we covered recent clinical research and results of immunotherapy in TNBC including PDL1 inhibitor, ADC, dual checkpoint inhibitor, CAR-T, neoantigen cancer vaccine, oncolytic virus-based therapies. There are challenges though opportunities in development of novel immunotherapy in TNBC.

A Social Interpretation of Overpopulation By Jaden Jansen

Abstract

Over 1 billion people live in extreme poverty and hunger, yet the poorest people in developing countries continue to reproduce, putting increased amounts of stress on the limited available resources and slowly harming the people (Mayhew & Colbourn, 2015). Overpopulation occurs when an area exceeds its recommended population capacity, often leading to external issues for the people and environment. However, population control methods are often unethical violations of human rights, creating a dilemma that seems to have no plausible solution (Anderson et al., 2021). Countries with limited access to reproductive education tend to overpopulate an already struggling population and greatly diminish their assets (Mayhew & Colbourn, 2015). Even though population control methods have worked in the past, they are often unethical ways of slightly lessening the population. Despite countless attempts to overturn an ever-expanding population, a permanent solution still has not been developed. With current population patterns inevitably continuing, the question of “To what degree does overpopulation affect the people?” remains prevalent in today’s society. Overpopulation impacts nearly all aspects of life in developing countries, from a lack of education to limited resources; the solutions proposed in the past are unethical, and so further solutions must be explored.

Average Children Per Woman in Developing Countries

Figure 2: Examples of how underdeveloped countries tend to reproduce at higher rates

Lack of Education

Many people in impoverished countries reproduce due to a lack of educational and health resources. This disparity greatly diminishes the essential resources for these developing countries and poses new challenges to the growing population. Mayhew and Coulbourn (2015),

Professor of Health Policy, Systems and Reproductive Health, say that poor countries had large increases in unwanted pregnancies due to a lack of information and education for women. They also claimed that African countries that had high unmet family planning needs were often poor and had no access to contraceptives. Furthermore, According to research by IIT Varanasi graduate and professor R.K. Mandal (2021), increased demand for food, water, and shelter in India, a poor and developing country, will result in even more starvation and malnutrition. The continued strain on essential resources in developing countries usually occurs due to a rapid increase in population, yet it is impossible to educate everyone on how to stop population growth, especially in developing countries with limited educational resources. Both Mandal, Mayhew, and Coulbourn outline a harsh reality for poor, overpopulated countries that cannot stop growth and resource deprivation. Mandal (2021) also believes that the Indian population will exceed 1.5 billion by 2031 due to upward trends in population growth. Continued population growth patterns combined with insufficient education will result in poor countries struggling to keep up with human demand, resulting in a loss of resources for millions of people.

Unmet Contraceptive needs

Figure 2: Unmet contraceptive needs in developed versus developing countries (People in millions)

Unethical Methods

Population control methods are effective ways of limiting overpopulated areas. However, these methods are often unethical violations of human rights. In a study conducted by Swedish professors Anderrson et al. (2021), they found that the Chinese one-child policy was effective in reducing the population but restricted human reproductive rights. They argue that the policy limits reproductive freedom, making it unethical. However, past population control methods were much more unethical than they are today. According to the University of Virginia graduate and policy analyst Follett (2020), India's extreme overpopulation emergency in the 1970s led

officials to conduct compulsory sterilizations with no legal authorization, resulting in 11 million Indians being sterilized with and 1 million women being fitted with IUDs, and 2,000 people dying from failed operations. While some methods to control the population have worked, others are immensely corrupt and aim to harm the people. Mass sterilization and reproductive limitation are not the answers to stopping populations from growing, as they only harm innocent people and violate their rights, as well as not causing a significant enough impact to reverse the effects of overpopulation.

Plans For the Future

Simply put, overpopulation only causes more suffering for areas that are struggling to meet human demands, deteriorating their already low resources and tormenting the growing population. This problem is further emphasized by the unethical attempts at limiting the population. Despite this, underpopulated and perfectly populated countries have developed methods to keep their populations in check. Bulgaria and Estonia, both underpopulated countries, have established fertility goals to keep the population at a certain level (Calder & Follett, 2023). If we established these goals in overpopulated countries, it would help people understand the dangers of overpopulation. Additionally, conservation biologist Whitfield notes that government intervention is a possible solution to overpopulation and the unjust methods associated with it, stating that the USDA has already helped poor minorities with solving issues related to overpopulation (Whitfield, 2019). Establishing more foundations to aid those affected by overpopulation and the methods used to stop it would bring great change to society. While the issue of overpopulation will never fully end, people with power need to take the right steps forward to help form solutions. If overpopulation continues to follow the same patterns it does today, many countries will be void of their essential resources and immoral control methods will be forced onto the people.

A New Legal Odyssey: Proposing an International Legal Regime for Exploiting Resources in Outer Space By Ying Hong Lim

Abstract

All across the world, nations and corporations scramble to reach outer space - to behold the Blue Marble in all its glory, and, pragmatically, exploit the vast quantities of metals lying dormant within asteroids. As more actors - public and private - strive to prospect and obtain these resources, it exposes the archaic inadequacies of space law, that fail to comprehensively dictate whether exploitation is permissible, how it could be undertaken, and how international order could be protected. It is foreseeable that, once astronautical technology is sufficiently mature, the absence of a coherent legal regime to govern exploitation in outer space could engender a “Wild West”, the frenzy of space mining, driven by prodigious profit, should soon ensue - violence that could incite international conflict. This demands the resolution of the legal quandary of: how should the Common Heritage of Mankind principle, declared to envelope the expanse of space, provide for a robust exploitation regime that promotes free enterprise and equitable outcomes for developing nations? These two antagonists wrestle in past precedent - the Law of The Sea, which similarly dictates an exploitation regime of seabed resources in the High Seas premised on the balance of these imperatives. Yet, to adapt exactly this prior model is to forgo vital consideration for its obvious failures. In this paper, I examine the conceptual foundations of the Common Heritage of Mankind principle, its oppositional interpretations, and its application in the Law of the Sea. Keeping in mind the recent developments in space law and the considerations for a global regime, I propose a solution that strikes a balance between free enterprise, and equity in the global order, driven by the merits of the Law of the Sea, and improvements from its faults.

Introduction

We are just now treading our way into the dawn of a new Space Age. As countries all around the globe hasten to bolster their space programmes, many announce their pompous plans to reach the Moon or Mars or the Sun by a certain decade. The United States had on November 16 of 2022 marked its return to the Moon, partaking in an ambitious space programme, *Artemis*, touted as the sister programme of the tremendously consequential Apollo programme. China has locked itself in an expensive show of nationalist pride, pouring billions into the *Long March* rockets, thus hastening our way to the second Space Race. However, this second round has a new upstart - the private enterprise. Private companies clamour to reach past the Kármán Line, some fuelled by the magnanimousness of billionaires to save humanity, but a far greater number eye the lucrative resources that lie above us. It is no fantasy to believe that soon private space travel will be the norm. The wildly successful SpaceX, in particular, launched more than one rocket per week in 2023, and has demonstrated reliable rocket reusability.

Asteroids carry in their hearts vast quantities of critical metals such as nickel, cobalt, gold, platinum and rhodium - materials prevalent in a majority of goods we consume. It is no

wonder that public and private agents alike all ogle at the prospect of space mining. When the capacity to exploit them is someday developed, this burgeoning new industry will be capable of reducing our concept of scarcity to its lowest denomination.

It is not entirely inconceivable that in the void bereft of a prevailing regulatory body a galactic wild west should soon arise. As the cosmic gold rush begins, states and firms may seek to protect space resources they exploit by way of force and intimidation. It follows, therefore, that a legal space regime that protects rights and accords obligations should be devised. In this article I shall examine the conceptual interpretations of the Common Heritage of Mankind principle, analyse how they have been applied to the Law of the Sea, and describe how the unique challenges of outer space should be considered. Lastly, I will propose a regulatory framework for resource exploitation in outer Space.

Common Heritage of Mankind

Rise of the CHM Principle: Ambitions for Order

The Common Heritage of Mankind principle generally declares that common heritage areas, such as outer space, the High Seas, and Antarctica, belong to all of humanity equally, and that no states may make claims to sovereignty in these areas.

It was the first codification of how international commons could be managed. International interest in the CHM principle was first generated when it was introduced in a speech by the Maltese Ambassador to the United Nations, Arvid Pardo in 1967. He was concerned over the abundance of resources that lay on the seabed in the High Seas, these polymetallic nodules contain manganese, nickel, cobalt and copper - critical metals heavily involved in the production of batteries. These materials lie untethered on the seabed of the high seas, and have been the subject of intense economic interest by mining companies. Today, they are viewed as the ultimate frontier to transitioning to renewable energy.

He recognised that the profusion of resources lying on the seabed outside of national jurisdiction would have grave implications for international order, and thus laid bare the impetus for declaring the High Seas the Common Heritage of Mankind:

“The known resources of the sea-bed and of the ocean floor are far greater than the resources known to exist on dry land... Present and clearly foreseeable technology also permits their effective exploitation for military or economic purposes. Some countries may therefore be tempted to use their technical competence to achieve near unbreakable world dominance through predominant control over the sea-bed and the ocean floor... The consequences will be very grave: at the very least a dramatic escalation of the arms race and sharply increasing world tensions, caused also by the intolerable injustice that would reserve the plurality of the world's resources for the exclusive benefit of less than a handful of nations. The strong would get stronger, the rich richer, and among the rich themselves there would arise an increasing and insuperable differentiation between two

or three and the remainder. Between the very few dominant Powers, suspicions and tensions would reach unprecedented levels”.

Pardo spoke of conflict, domination and inequality - he thought the growing technological powers of the developed world to be an existential threat to international peace and order. As the new, immensely lucrative frontier of the seabed opened up, the superpowers would certainly clamour and compete for a larger piece of that pie, fraying international relationships and leaving developing countries with but a meagre share of resources. Pardo believed that the divisions between the international stratification would become even more entrenched, where the developed nations become even more powerful while the developing nations are left to languish. Thus Pardo devised the CHM principle, enshrining the ownership of humanity as a collective over areas that lay outside of national jurisdiction.

Controversy of the CHM Principle: 5 Aspects, 2 Interpretations

While there is no satisfactorily agreed upon definition of the CHM principle, it is generally accepted to possess 5 key aspects. *First*, there can be no private or public appropriation of the commons, that is, none may claim sovereignty over any portion of it. Private property rights are therefore non-existent in these areas, for they are rights of exclusion and alienation that contradict common ownership of common heritage areas. *Second*, the management of the commons and the resources should be administered by representatives from all nations. Decisions regarding the commons should thus be made, at least to the closest possible extent, by humanity as a collective. *Third*, nations should share the benefits they gain from the commons and its resources. States and private firms that have succeeded in exploitation of natural resources should through inclusive mechanisms that account for other countries share their benefits to achieve equitable ends. This aspect aligns with the CHM principle. Given that common heritage areas belong equally to all of mankind, it follows that the resources extracted from these areas belong equally to all humans as well. *Fourth*, common heritage areas should be reserved solely for peaceful purposes and scientific advancement. All countries are responsible for maintaining the peace and security of the commons, thus armed conflict of any kind is neither desirable nor lawful under the CHM principle. *Fifth*, the management of the common heritage areas must be done in a sustainable and sensible way, so as to prevent the “tragedy of the commons”, shielding the common heritage areas from our avarice for future generations.

The most contentious aspect of the CHM principle is perhaps the third - that benefits derived from common heritage areas be shared with all nations. While it was laid out by Pardo in his impassioned defence of equity, developed nations have protested its implementation, unwilling to cede their rights to exploit the resources in common heritage areas freely. Here it is necessary to discuss the two oppositional interpretations of the CHM principle - the *rights to access* view advanced by developed nations, and the *rights to benefits* perspective held by developing nations.

Developed nations favour the view that the CHM principle should confer the rights to access. Given that the international commons are not subject to any national sovereignty, and held under ownership by humanity as a whole, it follows that any member of humanity is afforded the right to access and utilise the natural resources found in the commons. Developed nations thus believe in free access to resources in the commons, in the same way all humans have access to the commons themselves. This interpretation is most ideal for private enterprise, for it unlocks new frontiers of available resources that private companies can strive to freely obtain, without consideration for their equitable distribution. Developed nations stand to benefit the most, evidently, for they may leverage their superior technological development to exploit natural resources to the furthest extent, leaving developing nations in the dust as they hasten to engineer the capacity to extract these resources.

What will likely occur is the further entrenchment of inequality in the international community, or a more savage pecking order on the global stage, much to the detriment of developing nations who have been grievously dispossessed of the opportunity to benefit from these resources. This runs contrary to the original aspirations of the CHM principle, which aimed for the fair distribution of the benefits of these resources amongst all countries, so that all may share in the fruits of exploitation and enjoy their entitlement to the products of their common heritage.

Developing nations, on the other hand, believe that the CHM principle should allow for rights to benefits. Under this doctrine, all benefits, resources or economic gain should be shared equally across the international community. After all, the international commons have been designated the “common heritage of mankind”, indicating that humanity as a collective should stand to benefit from the resources they all own, rather than the few reaping profits from them. It does not follow that certain people should be entitled to the benefits of common resources, particularly since the commons are held under the collective ownership of mankind. Clearly, this approach is giddily optimistic, and perhaps the most appropriate conception of the CHM principle in itself - that the international commons, owned by all, should benefit all.

Yet this is at loggerheads with free private enterprise. It nullifies the economic imperative for exploitation of natural resources, for firms simply see no incentive to marshal their might to explore, survey and exploit the resources in the commons since any benefit they obtain must be shared with the rest of the international community. It is unlikely then that efforts to exploit these resources would be mustered, if nations or firms are not guaranteed to benefit from their efforts to exploit. Humanity could miss out on benefiting from these resources entirely. In the romantic quest for common development, the very possibility of development itself has been sacrificed.

Both views are meritorious and detrimental in their own right. For their flaws, it can be concluded that no one single interpretation should be effectively put into practice. Rendered in these terms then, it could be persuasively argued, that the original intents of the CHM principle has not translated faithfully into its corporeal forms. Yet that is perhaps the best course of action that international laws can meaningfully undertake, given the various practical hurdles that the CHM principle encounters. What is necessary (and what has been attempted) is to strike a

balance, to erode the equitable inclinations of policy in common heritage areas and to bridle the fervour of private enterprise. The object of this paper is thus to investigate the precedent of this balance, to scrutinise its merits and demerits, and apply them selectively toward the management of resources in outer space. To this end I look toward the Law of the Sea, the sole practical implementation of the CHM principle.

The Law of the Sea

UNCLOS: A New Hope for Maritime Order

In 1967 Pardo ascended the podium before the General Assembly of the United Nations. Over the course of the next three hours the fate of the High Seas would become radically altered. He delivered unto the international community electrifying rhetoric where he moulded the contours of the CHM principle today, asserting that the High Seas must be placed under the doctrine of the “common heritage of mankind”.

Pardo asserted that humanity had before it the golden opportunity to utilise natural resources to bridge the gap between the developed and developing nations, suggesting that no state should claim or exercise sovereignty or sovereign rights thereupon, and their use shall be reserved exclusively for peaceful purposes. No exploitation was to be conducted outside the “international regime”, including an “appropriate international machinery”, to be established “by an international treaty of a universal character, generally agreed upon”. Galvanised finally into action, the UN took, under the zealous urging of the Maltese Ambassador, its first tentative steps towards the remaking of an international maritime legal regime.

In the foreground of these revolutionary declarations, the number of independent states had doubled in the decade before Pardo’s speech. The proliferation of sovereign nations presented a stirring sense of distrust for the 1958 Geneva Convention on the Law of the Seas, which was not ratified or acceded to by these fledgling states. These new states wearied of Grotius’ *laissez faire laissez passer* condition that still dominated the High Seas, where the absence of an equitable legal regime permitted the unfair exploitation of seabed resources. They would most certainly be left behind as the technologically advanced nations plundered the resources on the seabed. The rungs on the international ladder would be spread even further apart.

It was the confluence of the two trends that ushered in decades of negotiations for an all-encompassing legal regime, one that delineates rights, duties and obligations for states at sea. From these negotiations the UNCLOS arose, providing new maritime limits on the jurisdiction of states, protecting the rights of landlocked nations, and creating a novel regulatory solution to achieving equity on the seas. It outlines regulations to exploit living and non-living resources on the High Seas, and entrusting the application and interpretation of its articles under the purview of international judges and arbitrators, namely the International Tribunal for the Law of the Sea, or the International Court of Justice or arbitral tribunals.

The UNCLOS came into force in 1994, and thirty years later, 168 countries and the European Union have become parties to the agreement. One notable outlier, however, is the United States of America, who opposed the provisions of Part XI - the creation of the International Seabed Authority as the steward of the mineral resources found in the High Seas, which they revile as Orwellian and heavy-handed. Till this date, the US has yet to ratify and accede to the UNCLOS, and remain an outside observer to its proceedings.

It is necessary to note that Pardo's original proposal diverges from the current interpretation of the CHM principle in the UNCLOS. His proposal was met with opposition from developed nations, who were understandably unwilling to cede their rights to exploit the seabed for their own benefit. Over the course of UNCLOS I, II, and III in 1958, 1960 and 1967 respectively, the CHM principle had become *jus cogens* in international law, but had been altered till it differed with what Pardo had originally envisioned. Pardo himself bemoaned that the CHM principle had been reduced to "a few fish and a little seaweed". Whereas Pardo had intended for resources to be reserved solely for the betterment of mankind as a whole through fully equitable sharing, the UNCLOS in its final form advanced the middle ground between private enterprise and equity. Despite these controversies, the UNCLOS is feted as one the most momentous achievements in international law, that it is the "constitution of the oceans" and a "world order treaty".

The International Seabed Authority: A Force for Good?

The International Seabed Authority (ISA) was created by the UNCLOS in Part XI of the agreement, and tasked with regulating and controlling the exploitation of seabed resources that lie in the high seas, outside of national jurisdiction. It's aspirations are delineated by Article 140 of the UNCLOS:

"Activities in the Area shall, as specifically provided for in this Part, be carried out for the benefit of mankind as a whole," and to this end, "The Authority shall provide for the equitable sharing of financial and other economic benefits derived from activities in the Area through any appropriate mechanism, on a non-discriminatory basis."

The ISA is given the arduous task of operationalising the CHM principle, aiming to ensure equity while balancing economic imperatives - two nearly mutually exclusive ideals. It comprises three principal organs, the Assembly, the Council and the Secretariat. The Assembly is the highest decision-making body in the ISA, while the Council consists of the Legal and Technical Commission and the Economic and Planning Commission, the latter of which lies dormant predominantly due to a lack of funding.

The UNCLOS positions itself in the middle between the two antagonistic interpretations of the CHM principle. It believes in the value of private enterprise, that is it vital if resources are to be developed, yet strives not to forsake developing countries who would be alienated from the exploitation of seabed resources. Administered through the ISA, it institutes a global licensing

regime where mining contractors are mandated to submit plans to the ISA if it wishes to explore or exploit seabed resources in the high seas. The ISA thus serves as the highest regulatory body for global exploitation efforts, and requires that contractors pay certain royalties on the revenue they garner from these resources, to supply the funds required for redistribution measures to developing countries. Portions of the revenue earned from exploitation of resources is proposed to be funnelled directly to these developing states, thus supplanting the ISA's efforts for equity.

In principle, the balance favoured by the ISA - that neither approach (*rights to access* or *rights to benefits*) should be implemented absolutely over the other - is meritorious. It is unlikely that any approach featuring purely a *rights to access* or *rights to benefits* structure will ever be acceded to by the majority of nation states, nor is it practical to do so. Unfortunately, the ISA's attempts to translate this nuance to reality proves troubled and highly problematic. If we are to adroitly adapt this balanced approach to outer space, we must first examine the merits and demerits of the precedent regulatory models of the ISA.

Legitimate concerns persist over its operations, namely the two questions of - how exactly will the ISA achieve equity, and has the ISA truly served its function as the bulwark against the tragedy of the commons? Both equity and sustainable development are the foundational ends of the CHM principle, and I argue that the UNCLOS and ISA have failed to achieve them, due to the (A) falling through of the technology transfer regimes, (B) the problematic redistribution mechanisms, and more pertinently (C) the oversight in accounting for environmental degradation caused by deep seabed mining. The balance struck between the two contrasting ideals is imperfect and flawed.

A. Technology Transfer

The UNCLOS and the US recognise the different technological capacities of developing and developed nations as an impediment to the equitable distribution of benefits obtained from exploiting resources in the commons. The UNCLOS sought to overcome these differences by way of technology transfer. Under Article 266 (1) and (3) respectively, the UNCLOS demands that “*States, directly or through competent international organizations, shall cooperate in accordance with their capabilities to promote actively the development and transfer of marine science and marine technology on fair and reasonable terms and conditions*”, and “*States shall endeavour to foster favourable economic and legal conditions for the transfer of marine technology for the benefit of all parties concerned on an equitable basis.*” It sets out that states should provide for the development of geographically-disadvantaged nations, landlocked countries and developing nations by establishing programmes for direct technological transfer, promote the conditions necessary to enter into agreements or contracts, hold symposia, conferences and meetings to disseminate scientific information, and encourage the exchange of scientists and technology experts. What ostensibly appears to be an egregious and heavy-handed approach towards equity by potentially compelling nations to disclose sensitive military technologies is fortunately clarified by Article 302, which states that “*nothing in this Convention shall be deemed to require a State Party, in the fulfilment of its obligations under this*

Convention, to supply information the disclosure of which is contrary to the essential interests of its security.”

Yet, this provision still remains contentious. It is true that sharing technologies, particularly technology used in deep seabed mining levels the playing field, allowing developing and developed nations both the opportunity to benefit from the resources found in common heritage areas. However, it is perhaps excessively quixotic in that states simply lack any incentive to transfer their technologies to one another. The UNCLOS is devoid of any enforcement mechanism that engenders rigid compliance in the international community. Furthermore, previous provisions mandating technological transfer were replaced by section 5 of the annex to the 1994 Agreement amending Part XI of the Convention. Beyond the nagging sensation that the UNCLOS should be complied with, states have generally been reluctant to disclose or share their mining technologies with other states, given that their firms are in direct competition with one another, each seeking licences from the ISA to prospect and exploit the lucrative minerals that lie on the seabed. Since their technologies are patented, proprietary and protected, sharing them spells certain death for their competitive advantage in the global mining frenzy. The economic imperative for retaining their technologies thus more than outweighs any intangible benefit of enthusiastically complying with Article 266. Technology transfer is therefore neither mandatory through provision, nor economically sensible for the benefactors.

While there have indeed been occurrences where marine technologies have been shared with other countries, more notably through the Montreal Protocol, the potential for the UNCLOS as a means of an equitable oceanic order is largely unrealised simply because states are not convincingly compelled to share their technical expertise. A more equal global playing field could have been reasonably realised, if mechanisms for technological transfer were more polished. A more sophisticated system must involve incentives for developed nations to provide and partner with developing countries, and through international cooperation allowing their technologies to diffuse down the international order.

B. Redistribution Mechanisms

In the spirit of advancing the CHM principle while maintaining elements of private enterprise, under the Draft Regulations crafted by the Council in 2019, contractors “shall pay a royalty in respect of the mineral-bearing ore sold or removed without sale from the Contract Area”. The method of imposing royalties is not one in contention here, rather the means by how redistribution is undertaken is problematic. Pertinent questions still hang in the air, particularly how funds would be distributed amongst developing nations. In a bid to resolve these quagmires, the ISA in 2022 curated its Technical Study 31 (TS31), identifying crucial policy questions that the ISA desperately needs to resolve. MIT consultants to the ISA Secretariat have proposed a payment model set at 2% of the total value of extracted metals for the first five years of production, subsequently raised to 6% thereafter.

The prevailing position for a viable redistribution mechanism for the ISA is through direct distribution, that is, funds obtained from royalties or optimistically from the Enterprise’s

operations be apportioned and shared with nations, predominantly developing countries. Equity dictates that each nation does not receive the identical amount from these funds, and thus the financial benefits must be apportioned in ways that reflect the countries' respective capacities. This increases each country's welfare to the furthest extent. TS31 suggests that criteria be founded on ownership, and/or income distribution. Ownership refers to the per capita distribution, with states with larger population sizes receiving a larger size of the benefits. This is ostensibly sensible to consider, given that the CHM principle describes the commons as under the ownership of humanity, that is, all humans share equal ownership of common heritage areas, and thus the benefits accrued from them. To redistribute on grounds of income also reflects the ambitions of Article 140, taking into greater account the needs of developing states.

However, these are narrow conceptions of development levels and therefore less useful to differentiate payments based on such. Other metrics of development such as Human Development Index and the Gini Coefficient are important in understanding the true level of development in developing countries, yet are not reflected in the ISA's redistribution considerations. If the ISA fails to accurately conceive of the level of development in its beneficiary countries then the directive that the ISA should provide for the equitable sharing of benefits is no longer fulfilled. Other considerations, such as whether landlocked countries should receive a greater share owing to them being naturally deficient to sea resources have been proposed. It is clear that there exists great ambiguity on how payments should be apportioned. Even if a viable system is someday decided upon, it would be met with protests from an array of aggrieved countries who believe themselves more deserving of larger shares of the profits. These disputes then must be proficiently and swiftly resolved.

Beyond the arbitrariness of direct distribution schemes, it is important to understand that the payouts through this mechanism are disconcertingly small. Under the assumed \$500 million in profits applied by the ISA in its calculations for redistribution, more than half of states are predicted to receive less than US \$50,000 per annum in the medium term. This sum is quite clearly negligible in the administration of state affairs. The redistribution mechanism of the ISA is thus impractically executed, and its methods to achieve the ideal of equity remain ambiguous and heavy-handed.

C. Sustainable Development

More crucially, one must question the effectiveness of the ISA in preventing the tragedy of the commons, the original, foremost and most critical object of the CHM principle. There is common scientific consensus that authorising deep seabed mining would be plainly apocalyptic and deleterious to the deep sea environment, known widely to be the largest habitat for life on Earth. Seabed mining will upend the sediment's geochemistry, leaving its animal inhabitants stranded and flailing. Removing the polymetallic nodules scattered across the abyssal plain would mean the disappearance of multiple sponges, crabs and clams. More concerning, the very operation of mining itself generates plumes of sediments during dredging of the seafloor and the processing of minerals. These sediments could smother ocean life, depriving sponges and

coral of the ability to filter food from water. Researchers have observed the catastrophic effects of experimental mining in the Clarion-Clipperton Zone and Peru Basin, where mined areas were largely devoid of living animals, even after forty years of recovery. It is likely that the environmental damage on the ocean would be both pernicious and irreversible.

Defiant in the face of glaring scientific proof, the ISA has entered into 29 15-year contracts with private firms to exploit materials in the seabed. Even as calls for a moratorium on seabed mining as a precautionary principle are sounded out by numerous governments and corporations, the ISA appears to have dismissed the environmental concerns and are resolute on their convictions to exploit the seabed. It is the duty of the ISA to account for the environmental damage that mining activities could cause, and act, in the presence of strong scientific evidence, to prohibit companies from partaking in resource exploitation efforts. This calls into scrutiny if the ISA has indeed fulfilled the directive set out by the CHM principle in the UNCLOS, that common heritage areas, including the environment, its biodiversity and its resources should be sensibly and sustainably protected for future generations of mankind.

Given that the ISA has stuck stubbornly to its doctrine on seabed mining, it has failed to take into account the environmental damage that resource exploitation is proven to deliver to the underwater biome, thus forsaking the most cardinal aspect of the CHM principle, leaving the commons vulnerable to rabid private enterprise.

Lessons for the Interstellar Future

Nearly thirty years after the inception of the ISA, the operationalisation of the CHM principle still hangs in the air. What could have been the dawn of a new cohesive maritime order was regrettably let down by the ISA. The ISA, with its flailing technology transfer regimes, byzantine redistribution mechanisms and brazen contravention of the original tenet of the CHM principle, is mired in internal strife and turbid objectives, a far cry from the sensible and efficient regulatory body imagined by the drafters of the UNCLOS. Crucially, because of these practical and legislative deficiencies, the ISA mishandles the nuances of free enterprise and equity, providing an inadequate operationalisation of the CHM principle. We can seek solace in the fact, however, that the tumultuous conception and operations of the ISA shows us precisely what a future international legal regime for outer space must not embody.

The Context of Outer Space

Foundations of Space Law: The Gathering Storm

The foundations of space law were first created amidst the gathering storm of the 20th century. As the post-war superpowers marshalled their energies towards the singular directive of ideological warfare, the USA and the USSR obliged each other in unbridled technological competition - the first Space Race. Amidst cutthroat competition, the US bristled at the launch of the Sputnik in 1957 - the first man-made object to reach space. It dawned on the rest of the world that it would not be long before a Soviet nuclear weapon could be strapped to a launch vehicle

and catapulted into the tenuous boundary at the edge of space, hanging precariously over the heads of Americans like a literal sword of Damocles. Thus, the US proposed a non-armament treaty for outer space, one that expressly prohibited the installation of weapons of mass destruction in outer space, suggesting that the Antarctic Treaty of 1959 could serve as inspiration for this doctrine. Thus, in 1967, in the eye of the storm the Outer Space Treaty was born, boldly declaring that:

“The exploration and use of outer space, including the moon and other celestial bodies, shall be carried out for the benefit and in the interests of all countries, irrespective of their degree of economic or scientific development, and shall be the province of all mankind.”

Taking inspiration from the Law of the Sea and Pardo’s ambitious proposal of the CHM principle, the Outer Space Treaty designated outer space as the “province of mankind”. It is generally accepted that the concepts of “province of mankind” and “common heritage of mankind” are indistinguishable from each other. As of 2024, 115 countries are parties to the treaty, including all major spacefaring nations. In the decades following this landmark treaty several others emerged, expanding upon the rights and obligations of spacefaring nations, such as the Rescue Agreement, Space Liability Convention, and Registration Convention.

Ambiguity of the Outer Space Treaty: The Rise of Property Rights

The Outer Space Treaty is notorious for its ambiguity. It paints in broad strokes what form the legal regime in outer space should assume, leaning more towards espousing the CHM principle rather than tangible policy measures that seek to regulate exploitation in outer space. Here it most starkly diverges with the UNCLOS. Whereas the UNCLOS is highly detailed with specified policies, the Outer Space Treaty is woefully inadequate in this regard. Granted, the level of technological development in 1967 did not warrant any pressing concerns of exploitation, but the space industry today is no longer fledgling nor immature. The contentious portion of the Outer Space Treaty, Article II states that:

“Outer space, including the moon and other celestial bodies, is not subject to national appropriation by claim of sovereignty, by means of use or occupation, or by any other means.”

Crucially, the Article speaks only of national sovereignty, but remains silent on private property rights. Some have taken it to mean that private individuals could in fact own parts of outer space, and by extension, its resources.

In recent years, some countries have seized on the vagueness of the provisions to advance their own property rights regime in Outer Space. The US, Luxembourg, UAE and Japan have all enacted legislation that in some way points toward a system where private property rights can be

declared in outer space. The Outer Space Treaty is hence ambiguous and in need of further advancement. This refinement is necessary to confer legal certainty for interested companies, so that they may be given the assurance that their exploitation efforts are lawful and permissible under the CHM regime.

A. United States of America

The American Space Resource Exploitation and Utilization Act (SREUA) guarantees that:

“[US citizens] engaged in commercial recovery of an asteroid resource or a space resource under this chapter shall be entitled to any asteroid resource or space resource obtained, including to possess, own, transport, use, and sell the asteroid resource or space resource obtained in accordance with applicable law, including the international obligations of the United States.”

This protection runs contrary to the CHM principle, where particular consideration for developing countries is demanded to achieve equitable outcomes. The American model however protects the rights for US citizens to freely exploit and own outer space resources, and to use it absolutely to their own benefit without regard for equity. While laudable for its efforts to spur private enterprise and commercial interest, this Act will leave the commons open to plunder and rapacious exploitation by private companies, leading us onto a road toward the “tragedy of the commons”. SREUA also recognises the need to comply with the provisions of international law, with Congress stating that “it is the sense of Congress that by the enactment of this Act, the United States does not thereby assert sovereignty or exclusive rights or jurisdiction over, or ownership of, any celestial body.”

B. Luxembourg

Luxembourg soon followed suit with its Use of Resources in Space Act, aiming to provide legal certainty as to the ownership of minerals and other valuable space resources. Luxembourg boldly declares that space resources can be appropriated, adopting the US definition of “space resources”, and instituting a form of licensing system where licensed activities are permitted and licences cannot be transferred. Citing Article I of the Outer Space Treaty, where “Outer space... shall be free for exploration and use by all states”, Luxembourg propounds that mining is purely a “use” of space, and does not apportion any profits for redistribution, supporting the *rights to access* interpretation discussed earlier. In that sense, the Luxembourg law does not impose any requirement for the government to work meaningfully with the international community.

C. United Arab Emirates (UAE)

The United Arab Emirates (UAE) had in December 2019 passed Federal Law No.12 on the Regulation of the Space Sector. The law applies to individuals who hold nationality of the USA and to companies headquartered in the country. It describes that the regulated space activities include that of exploitation of space resources, and that a permit is required to engage in space activities. Permits are not allowed to be transferred except with prior approval. How the permits will regulate the exploitation of space resources, particularly the “*acquisition, purchase, sale, trade, transportation, storage*” of exploited resources are yet to be fully decided by the Council of Ministers. The laws mandate that the Emirates Space Agency support international agreements that further their own objectives set out by their laws.

D. Japan

In 2021, Japan became the fourth country to enact laws that protected private property rights in the pursuits of private space exploitation. The Act on Promotion of Business Activities Related to the Exploration and Development of Space Resources codifies that companies can acquire ownership over space resources, “*if the government approves their notified objectives, timing and methods of research.*” The Act also requires that firms seek a permit to engage in space activities, and only individuals who seek to launch a spacecraft from Japan’s land or those who wish to control a spacecraft and have the control facility within Japan’s land may seek a permit.

Recent Developments: Their Place In the CHM principle

That private property rights have been codified into the laws of some of the major space-faring nations is highly disconcerting. It marks the shift toward the *rights to access* interpretation for outer space, and shuns the theoretical balance propounded by the UNCLOS. Due to the ambiguity of the Outer Space Treaty, states have leveraged upon its vagueness to further their own national agenda.

Private property rights in outer space are problematic for multiple reasons, firstly that it disregards the deleterious effects that this *rights to access* approach to the international commons will wreak on the international order. Equity in the international community will worsen as developed nations rake in vast resources and revenues while developing countries are left behind. This directly contravenes the CHM principle, that the benefits from the resources in common heritage areas should be shared with all and used for the advancement of humanity as a collective. It betrays the notion that the resources are held under the ownership of humanity as a whole, rather than the technologically-capable few. This engenders a more unequal world order.

Furthermore, this approach will encounter issues of enforcement. The Outer Space Treaty expressly prohibits nations from claiming sovereignty over areas in outer space, similar to Antarctica and the High Seas. This means that there are no regulatory bodies whose authority is guaranteed by force to enforce and protect the private property rights of private companies. Simply put, beyond the threat of violence, enforcement measures are likely futile. What is gravely concerning is that prospectors and exploiters would soon equip themselves with the

means to impose this threat on others in a bid to defend their property from others. Rendered in these conditions, it is foreseeable that outer space could evolve into a Wild West rife with conflict as companies scramble to extract and claim resources for their own. With no overarching body to regulate these activities, these tensions and confrontations threaten to tear the international order asunder. This is far from compatible with our ideals for global justice and international harmony.

Considerations For a Cosmic Exploitation Regime

What is necessary is a regulatory body created in similar fashion to the International Seabed Authority, but adapted to the unique rigours of outer space, and removed of the practical deficiencies that plague the current Authority. While this could very well be derided as Orwellian or the cold fist of world government enclosing around the affairs of states, I view it as instrumental for preserving order in the cosmic gold rush that will soon occur. It is imperative that this Authority be constructed soon, for the recent codifications of property rights by the four countries could trigger a further cascade of major spacefaring nations doing the same, amounting to the effective abandonment of the CHM principle or the tacit renunciation of it. The view that private property rights are compatible with the CHM principle is corrosive and deleterious to a concordant world order.

To fully devise a coherent legal regime for the exploitation of space resources, it is critical that the effects of such activities on different stakeholders be evaluated. The CHM principle must then be implemented and operationalised in such a manner as to ameliorate the effects on the inevitable losers of the rise of space resource exploitation. The industry is admittedly fledgling and still in its infancy, hence the future impacts on society, equity and international cohesion are nebulous and difficult to predict. Based on present observations however, it is not unreasonable to estimate that (A) countries dependent on terrestrial mining would be grievously affected, alongside (B) societies whose governments have failed to stave off the nefarious threats of corporate monopolisation.

A. Countries Dependent on Terrestrial Mining

Unlike seabed mining, which promises far lower returns than the astronomical quantities of metals present in asteroids, space mining has the potential to introduce into the world economy tremendous volumes of critical metals crucial for the provision of basic goods and services. This almost inevitably spells the demise of developing countries whose entire economies lean heavily on terrestrial mining. Take for example South Africa, the world's largest producer of platinum at around 74.3 percent of the world supply, employs nearly half a million workers in the industry, itself comprising 8.2 percent of its GDP. In 2018, it produced roughly US 3.8 billion dollars worth of platinum. In comparison, some asteroids have been estimated to possess platinum compositions worth more than US 50 billion dollars. The sheer abundance in outer space dwarfs terrestrial mining, and it threatens to kick the chair out from under developing nations that rely greatly on traditional mining. In a more extreme instance, the economy of

Democratic Republic of Congo (DRC) rests even more heavily on their natural minerals, namely cobalt, producing around 70 percent of the world's supply, employing 12.5 million workers.

Minerals extractions are among the few economic engines that this underdeveloped nation runs on, and if space mining becomes the norm, the DRC will be left flailing without alternative sources of income to turn to. Deprived of the economic lifeline, these countries would be devoid of the necessary financial resources to administer social aid and institute policies that protect those adversely affected. Unemployment rates would likely rise, as economic growth falters and the slew of concomitant social problems of crime and unrest would soon set in.

The issue of equity in the spectre of space resource exploitation is one far more complex and orders of magnitude larger than that of seabed mining. The vast quantities will stretch the rungs of the international ladder so incomprehensibly far apart that developing nations will likely never be afforded the opportunity to exploit what belongs to them as well. The deluge of the outer space metals into the terrestrial economy will likely flow directly to developed nations, leaving developing nations in the dust.

B. Monopolies

In a similar vein, issues of monopolisation are also brought to the fore. Under a *rights to access* model that favours private enterprise, companies will strive and scramble to exploit outer space resources without regard for developing nations. Consequently, the enormous quantities of resources will be concentrated in the hands of the few, technologically capable mining companies, inviting disturbing prospects of powerful monopolies. The Aluminium Company of America, International Nickel Company of Canada, and the De Beers Company each acquired rights to virtually all of the world's supply of aluminium, nickel and diamonds respectively, transforming each company into a global monopoly in sole control of prices and supply. It is difficult to conceive of what a future space economy will embody, but if proper regulatory provisions are not put in place it is reasonable to predict that an oppressive monopoly will arise. The resources accrued by these companies are not distributed or shared with the rest of humanity, instead lying idly in their coffers, waiting to be sold. This is an egregious betrayal of the CHM principle as resources obtained are used to benefit the firms, rather than the whole of humanity.

This brings forth other economic detriments including inefficiency, creation of artificial scarcities, eroding innovation, and in the particular case of outer space resources, the concentration of prodigious industrial power in the hands of relatively few companies. The metals accrued from the exploitation of outer space resources are critical for heavy industry and employed widely throughout the world, forming critical components of everyday necessities and appliances. To afford a select few firms with such staggering volumes of such metals is to place in their hands undue influence and authority over world trade and economic affairs. Given global interest in the exploitation of outer space resources, it is clear that these monopolies will not merely manifest on the national level, but pervade international affairs as well.

The Next Step for Man

Resource exploitation in outer space is perilous in how it could swiftly cleave divisions between the international order. As a result of the sheer magnitude and scale of the rewards from exploitation, the degree of inequality between developed, technologically advanced states and developing countries will become astronomical. We risk forging an unforgiving world where might makes right, causing the international fabric to become even more frayed and tenuous. It follows that an overarching regulatory body that oversees, moderates and negotiates the competing practices of states is necessary to fortify the tenets of the CHM principle.

I present, in the following chapter, my conceptions of what a viable solution should look like. It encompasses the best of UNCLOS' initiative, following in the footsteps of its balanced interpretations of the CHM principle. Rejecting its gross impracticalities however, I also account for the unique divergences in the situations of the High Seas and outer space, adapting my solution to the larger scale and magnitude of space mining.

The Solution

This industry and its economics are nascent. The spectre of space resource exploitation is one that has been hotly pursued since the Apollo years, but is only just now, decades later, materialising. As obscure as the future may be, it is useful to entertain ideas for a potential adaptation of the ISA for outer space. A meaningful solution should encompass the primary ideals of the CHM principle and account for the five generally accepted characteristics of the CHM principle. The CHM principle is not without its flaws or practical defects, but I maintain that it remains the best possible model for regulating the commons, to protect what belongs to humanity from humanity's most sinister proclivities. We must therefore, through the first principles of the CHM model, strive towards the condition of equity and equal opportunity.

The International Outer Space Authority

I propose that a regulatory body similar to the International Seabed Authority be created to administer a quota-based system of tradable permits for outer space resource exploitation. This regulatory body, which I shall henceforth term "the International Outer Space Authority (IOSA)" should likewise strike a balance between the two interpretations of the CHM principle. The structure of the IOSA should mimic that of the International Seabed Authority, in particular the Assembly, the highest decision-making body of the ISA. All states parties to the new outer space legal regimes are thus represented in the Assembly, allowing for the commons to fully and effectively be administered by humanity, or its representatives, as a whole.

Equality of Opportunity with Equitable Characteristics: Quotas with Tradable Permits

Under this system, each country is afforded a certain quantity of permits, proportional to the size of its population. This embodies the core principle that humanity as a collective holds ownership of the commons and its resources, and thus are given the equal opportunity to develop and benefit from these resources. These permits give firms the right to exploit, and refer to the mass of outer space resources each country may mine, and the global quantity of which is

decided upon by the IOSA, through its organs similar to that of the Legal and Technical Commission of the current International Seabed Authority. I shall discuss (A) the issuing of periodic quotas, (B) the mechanisms of applications of tradable permits, and (C) the trading and sharing of permits.

A. Periodic Quotas: Size, Cycle and Frequency

Sustainability, safety, and harmony *inter alia*, are considerations that the Council must concern itself with, and the issuing of a set number of permits per cycle endows the IOSA with a proficient way of moderating the degree of exploitation in outer space through exploitation limits. The period in which permits are issued by the IOSA could be two or three years or more, due to the long gestation periods needed for space resource exploitation projects to take off. Issuing a new batch of permits on a yearly basis or shorter, would simply render the instrument of the IOSA to subdue the fervour of space mining obsolete.

B. Mechanisms of Applying for Permits

The applications for these permits should not be directed to the IOSA itself, unlike the case of the International Seabed Authority, but rather toward countries' governments themselves. In respect to the individual legislation of countries outlining their licensing regimes as above, governments should be the bodies who receive and process applications for permits by firms within their country. Unique arrangements between governments and hopeful corporations could be struck so that the potential threat of monopoly power is diluted and a certain quantity of exploited resources is apportioned for public use. Governments are most familiar with what their nations require, which industries are in dire need of revitalisation and that which are flourishing. It is in their interest to protect the prosperity of their people and deny corporate oppression in the form of monopolistic power, and they may do so through legislation, by leveraging the permits issued by the IOSA to enforce checks on safety and anti-competitive behaviour. This holds firms accountable and provides a legitimate enforcement mechanism for transgressors of international law.

Importantly, the IOSA should be empowered with the overarching veto power for firms it deems to have contravened its regulations, if the activities of firms sanctioned by their individual governments prove to be discordant toward the global order, or incite conflict with firms of other countries. These activities would include mining at a similar location as that of other firms, which could invite conflict between the two parties as they wrestle over exploiting the same resources.

C. Exercising, Trading, and Sharing of Permits

On the issue of equity, these permits may be sold, purchased or shared under mutually agreed terms. Developing countries who lack the technological capability, political will or natural resources to exploit these space resources may sell their share of permits to developed countries intent on exploiting more resources. In this way, the notion of equal ownership of the

commons by all individuals of humanity is protected and developing nations likewise receive benefits from their ownership of common heritage areas. Thus, as developed nations encroach on the rights of developing nations to exploit resources, they shall compensate them with an agreed sum of money that will aid in their improvement. While it may be argued that they are not shared with the benefits of exploitation of resources, they are endowed with the benefits arising due to space exploitation, and may use the funds garnered from these transactions to bolster their economies and develop their societies, in the hopes that they too will one day reach the stars.

Another method countries may employ is through the sharing of permits. As developed countries are enamoured by the promise of more resources to be exploited, developing nations can enter into bilateral programmes with developed nations and work with them on spaceflight projects. Under mutually agreeable terms of trade, developing nations can offer developed countries a share of their permits, while developed countries “show them the ropes” of administering space programmes. Through self-directed - rather than UN-mandated - international partnerships, technological transfer and the sharing of prerequisite skills and knowledge of spaceflight can occur naturally and effectively. The tradable permits system is thus a catalyst for developing and developed nations to cooperate on outer space projects, each party benefiting tangibly and intangibly from these collaborations. It forms a series of incentives for developed countries to partner and share their knowledge and capabilities with developing nations.

As astronautical technology diffuses down the international order toward developing nations, they can build up their capabilities and over time, catapult themselves into space to finally claim their rightful share of resources. In both cases, the IOSA must keep a close eye on the agreements entered into between developing and developed nations. It must ensure that developing nations do not hasten into an agreement too gleefully that it leaves itself susceptible to be exploited by developed nations. In this regard the IOSA must conceive of organs and instruments that aid developing nations in obtaining for their rightful share of the pie.

The number of permits should be carefully calibrated to account for the level of technological development, for the international community must not be so inundated with the right to exploit more resources that developed countries no longer see the need to work with developing nations. Therefore, as new technologies are devised and spaceflight becomes more frequent, the IOSA should consider increasing the global number of permits issued while still maintaining the condition of scarcity to spur collaboration.

Rethinking Benefits-Sharing and Free Enterprise

Contrary to the redistributionist agenda of the International Seabed Authority, I favour a system of incentives to stimulate international collaboration between developed and developing nations, that leverages the IOSA's imposed scarcity of exploitable space resources. The magnitude of funds that developing nations would receive by trading their permits is likely to be far higher than the redistribution efforts of the ISA, for it is tied directly to the fervour of developed nations to partake in space mining. This benefits-sharing regime is less arbitrary and

prejudicial. It furnishes the key tenets of the CHM principle, providing a system where equality of the opportunity to exploit resources is protected, while accommodating equitable measures to support developing nations. Developed countries can under their own might and merit race to outer space to exploit resources, thus spurring salubrious international competition between firms and countries. This fosters the economic conditions necessary for humanity to fairly and efficiently benefit from the resources in outer space, furthering our civilisation while leaving no country behind. Developing nations are helped up the ladder, through the fostering of international collaborations and trading of permits, the otherwise real possibility that the commons would be used as an apparatus to exacerbate existing divisions between developed and developing countries is dispelled.

Conclusion

I offer in this paper a potential answer to a possible regulatory framework for the exploitation of resources in outer space. It first examines the conceptual origins of the central principle of the Common Heritage of Mankind, establishing that a balance should be struck between the antagonistic interpretations held by developed and developing nations. Keeping in mind aspirations of equity and fairness, I then look toward the precedent of this balance - the Law of the Sea. Assessing its merits and demerits, I find that the current equilibrium of equity and free enterprise dictated in the Law of the Sea through the International Seabed Authority is ineffective in unlocking valuable resources for humanity to benefit as a collective. I then adapt these lessons to the unique rigours and demands of outer space, accounting for the foreseeable detriments of an outer space mining regime on terrestrial affairs, thereby revising a redistributionist doctrine into a tradable permit, quota-based system that directs benefits surrounding space exploitation toward developing countries while incentivising firms and nations to reach for the stars.

The future of space, and the concomitant space industry is turbid and unclear. What is clear, however, is that humanity is making great strides towards this eventuality. It would be naive to believe that we shall never once more make our mark on the farthest reaches of the universe. The alacritous advancements made by SpaceX in rocket reusability, the clamour by governments to nurture domestic space programmes and enact laws favourable to cosmic enterprise, and the proliferation of private firms in the space industry, all point toward this inevitability.

While entrepreneurs and engineers push the envelope in their fields, lawmakers and international organisations must do the same for theirs. For all its uncertainty, it is likely that the benefits and detriments of the space industry, monetary and diplomatic, will be on a scale never before seen on our planet. It will either enrich and propel us together as a civilisation, or tear us asunder. Rendered in these stark terms, we should now embody the altruistic spirit that Pardo demonstrated on the podium of the United Nations General Assembly decades ago, and commence international proceedings to safeguard our peace, prosperity, and the common good of mankind, present and future.

Exploring the Link Between Periodontitis and Elevated Levels of Hemoglobin A1C

By Shely Shakhnovich

Abstract

This review describes the intricate and bidirectional relationship between periodontal disease and Type 2 Diabetes Mellitus (T2DM), emphasizing the complex interplay of biological, immunological, and microbiological factors that connect these two conditions. T2DM is a prevalent metabolic disorder characterized by insulin resistance and hyperglycemia that affects many people world-wide. Similarly, periodontitis is among the most prevalent oral diseases world-wide. Studies show that T2DM significantly increases the risk of periodontal disease, a chronic inflammatory condition that affects the supporting structures of the teeth. Individuals with diabetes are more susceptible to severe forms of periodontitis due to altered immune responses, poor wound healing, and increased systemic inflammation. Periodontal disease exacerbates glycemic control, creating a vicious cycle where each condition aggravates the other. This review focuses on the role of advanced glycation end products (AGEs), cytokine release, and the impact of a dysbiotic microbiome. These findings highlight the need for integrated healthcare approaches that address both periodontal health and diabetes management to mitigate the compounded risks associated with these associated conditions.

Introduction

Diabetes and periodontal disease are among the most prevalent chronic conditions worldwide. T2DM affects approximately 537 million adults globally in 2021, with an expected increase to 783 million by 2045 [4]. Similarly, periodontitis affects nearly 50% of adults aged 30 years and older, making it one of the most common oral diseases [3]. The relationship between periodontal disease and diabetes is bidirectional and complex. Research indicates that individuals with diabetes are at a higher risk of developing periodontal disease, with studies showing that they are up to three times more likely to suffer from periodontitis compared to non-diabetics. This heightened susceptibility is attributed to the altered immune response, poor wound healing, and increased inflammation associated with diabetes [4]. Conversely, severe periodontitis can negatively impact glycemic control in individuals with diabetes, exacerbating the condition and increasing the risk of diabetes-related complications [2]. Understanding this interconnection is crucial for the effective management and treatment of both conditions, emphasizing the need for integrated healthcare approaches.

T2DM is a metabolic disorder that affects the way the body processes glucose, which causes blood sugar levels to increase over time. Unlike type 1 diabetes, where the body fails to produce insulin, T2DM is characterized by insulin resistance, where the body's cells do not respond effectively to insulin, and relative insulin deficiency. This resistance results in elevated levels of hemoglobin A1C. Hemoglobin A1c is a blood test that measures average blood sugar levels over the past 2-3 months, helping to monitor and manage diabetes. T2DM is a significant

contributor to morbidity and mortality globally, as it increases the risk of cardiovascular disease, kidney failure, and other complications [2].

Pre-diabetes is a precursor of T2DM. Although not diagnosed as T2DM quite yet, patients with pre-diabetes might display similar symptoms as those with T2DM. Pre-diabetes is diagnosed when blood glucose levels are elevated but not high enough to be classified as diabetes. The following ranges are used to classify: Normal: below 5.7 A1C, Prediabetes: 5.7 A1C to 6.4 A1C, Diabetes: 6.5 A1C or above. The diagnostic criteria for prediabetes could also be a 2-hour plasma glucose level of 140–199 mg/dL (7.8 mmol/L to 11.0 mmol/L) on an oral glucose tolerance test; or fasting plasma glucose of 100–125 mg/dL (5.6 mmol/L to 6.9 mmol/L) [4]. For the majority of patients, most cases of pre-diabetes will eventually progress to diabetes. Reasons for pre-diabetes and diabetes that are not driven by genetic approaches are lifestyle factors, including nutrition, physical inactivity and obesity [4]. These facts continue to reinforce the importance of very early control at the pre-diabetes stage.

Periodontal disease is a spectrum of inflammatory destructive conditions that affect the periodontium, including the gum tissue, periodontal ligament that attaches the root to the bone, and the alveolar bone itself. The two most common forms of periodontal disease are gingivitis and periodontitis [3]. Gingivitis is the early stage of periodontal disease and represents inflammation of the gums characterized by sore, red, puffy gums that bleed easily when brushing or flossing the teeth. It is highly prevalent and affects 90% of the population at some stage in their life. If left untreated, gingivitis may progress into periodontitis, a much more serious disease. Periodontitis represents the inflammation extending further into the tissues, leading to the destruction of supporting bone tissue causing tooth loss.

Figure 1 - Comparison of healthy gums and gingivitis. The image on the left illustrates healthy gums with firm, pink tissue and no signs of inflammation. The image on the right shows gums affected by gingivitis, characterized by redness, swelling, and bleeding near the gum line (indicated by yellow arrows). Gingivitis, the earliest stage of periodontal disease, is a common complication in patients with diabetes due to impaired immune response and poor wound healing.

Periodontitis is a major public oral health problem, known for its widespread health repercussions, affecting close to half of the adult population 30 years and older [2]. The condition is closely associated with risk factors such as poor oral hygiene, smoking habits, and genetic predisposition. As periodontitis progresses into advanced stages, severe complications such as mobility of the teeth, formation of abscesses, and even extraction of these teeth could follow. Periodontitis also causes considerable inflammatory burden which has been associated with systemic health outcomes such as cardiovascular diseases, respiratory infections, and adverse obstetric outcomes.

Methods and Materials

Data Sources

This study conducted a comprehensive review of existing literature to explore the link between periodontal disease and diabetes. Relevant studies were identified using PubMed, a comprehensive biomedical database. The search was performed using the following keywords: "periodontal disease," "diabetes," "periodontitis," and "glycemic control."

Inclusion and Exclusion Criteria

Inclusion criteria encompassed peer-reviewed articles, systematic reviews, and clinical trials published in English between January 2000 and December 2023. Studies must have investigated the relationship between periodontal disease and diabetes, focusing on either pathophysiological mechanisms or clinical outcomes. This literature review excluded non-peer-reviewed sources, articles not available in full text, and studies not directly related to the link between the two conditions.

Periodontitis Overview

The Importance of Managing Periodontitis

Periodontitis is characterized by progressive destruction of the tooth-supporting apparatus and is defined as inflammation and destruction of the underlying supporting tissues of the teeth, also called the periodontium [7]. It is a chronic multifactorial inflammatory disease linked to dysbiotic plaque biofilms, in which there is an imbalanced composition of microorganisms. A microbial biofilm, made up of bacteria and extracellular materials, can accumulate along the gingival border in vulnerable people with insufficient oral hygiene. Biofilm is an aggregation of micro-organisms embedded in a matrix of exopolysaccharides and extracellular products, along with host-derived products including salivary proteins. Plaque starts out as a soft, white deposit on the tooth surface but hardens with the addition of salivary calcium phosphates to become calculus (tartar) within 7 to 10 days of accumulation and oral biofilm formation. This can lead to periodontal damage and inflammation. Decreased periodontal support can cause teeth mobility

and eventually lead to complete loss of the affected teeth; further care may be necessary to restore the lost function and look.

Figure 2 - The clinical presentation of a 22-year-old man with poorly-controlled type 1 diabetes and severe periodontitis includes widespread inflammation and significant tissue destruction as shown. The gingival anatomy is notably altered, with pronounced gingival recession, swelling, and spontaneous bleeding. Abundant plaque deposits are visible, and the periodontal tissues surrounding the lower incisors in particular are severely impacted. [8]

Gingivitis: The Early Stage of Periodontitis

Gingivitis is the earliest stage of a periodontal disorder. It is an inflammatory change that occurs only in the gingival area due to the host immune system reacting to microbial activity at plaque biofilm. The microbiology of gingivitis involves a complex community of bacteria, including species such as *Porphyromonas gingivalis*, *Tannerella forsythia*, and *Treponema denticola*, which are known to be key pathogens in periodontal disease.

Untreated gingivitis can lead to the breakdown of the epithelial barrier and the formation of periodontal pockets (Figure 2). These pockets create an anaerobic environment that favors the growth of pathogenic bacteria. As the biofilm matures and becomes more virulent, the host immune response intensifies, leading to the destruction of the connective tissue and bone that support the teeth. This can develop into periodontitis, a state in which periodontal inflammation begins to affect the supporting bone of the teeth. Increased structural complexity and pathogenicity of the biofilm, and a shift to dominance by Gram-negative, obligate anaerobic bacteria, are notable features of more advanced stages of periodontitis. The Gram-negative, anaerobic bacteria pathogenic for the oral cavity are largely confined to the periodontal pocket, responsible for periodontitis symptoms. The best-studied of these bacteria are collectively termed the 'red complex': *Porphyromonas gingivalis*, *Tannerella forsythia*, and *Treponema denticola*.

The microbial composition of the periodontal biofilm is diverse and dynamic. In a healthy state, the biofilm is dominated by commensal bacteria that have a symbiotic relationship with the host. In periodontitis, there is a shift towards a dysbiotic microbial community, where pathogenic bacteria outnumber beneficial ones.

The Transition from Gingivitis to Periodontitis

The transition from gingivitis to periodontitis is marked by an increase in the abundance and virulence of periodontal pathogens, disrupting host-microbe homeostasis. *P. gingivalis*, a keystone pathogen, plays a pivotal role in this process. It possesses several virulence factors, including fimbriae, gingipains, and lipopolysaccharides (LPS), which enable it to evade the host immune response, invade tissues, and induce a pro-inflammatory environment.

The host immune response to periodontal pathogens is a critical determinant of disease progression. The initial immune response involves the recruitment of neutrophils to the infection site. Neutrophils play a crucial role in containing the infection by releasing antimicrobial peptides. Chronic exposure to bacterial antigens, however, leads to a sustained inflammatory response characterized by the release of pro-inflammatory cytokines, such as interleukin-1 β (IL-1 β), tumor necrosis factor-alpha (TNF- α), and interleukin-6 (IL-6). These cytokines contribute to the destruction of the periodontal ligament and alveolar bone.

Figure 3 - A. 42-year-old man with type 2 diabetes and generalized severe periodontitis exhibits extensive alveolar bone loss, ranging from 50% to 75% of the root length across the entire dentition. The bone loss pattern is irregular, with some teeth, such as the upper molars and lower incisors, nearly losing all their supporting alveolar bone. These teeth are highly mobile and are retained in the oral cavity solely by the soft tissue attachment, having lost 100% of their bone support [8]. B. 21-year-old man without periodontitis displays normal alveolar bone levels. The crest of the alveolar bone is positioned close to the cemento-enamel junction, indicating healthy bone support [8].

Systemic Impacts of Periodontitis

Periodontitis is not only a localized oral health issue but also has significant systemic implications. Chronic periodontitis can have far-reaching effects on overall health. Epidemiological studies have established associations between periodontitis and various systemic conditions, including cardiovascular disease, diabetes mellitus, respiratory diseases, and adverse pregnancy outcomes.

The systemic impact of periodontitis is thought to be mediated through several mechanisms. One proposed mechanism is the direct invasion of periodontal pathogens into the bloodstream, leading to bacteremia, a presence of bacteria in one's bloodstream. Once in the bloodstream, these pathogens can disseminate to distant sites and contribute to the pathogenesis of systemic diseases. Another mechanism involves the chronic inflammatory burden imposed by periodontitis. The persistent release of pro-inflammatory cytokines from periodontal tissues can exacerbate systemic inflammation and contribute to the development or worsening of systemic conditions.

Type 2 Diabetes Overview

As opposed to type 1 diabetes, which results from an autoimmune response leading to a near-complete loss of beta cells in the pancreas resulting in an absolute absence of insulin, Type 2 diabetes (T2DM) is a metabolic disorder defined by insulin resistance, which is impaired responsiveness to insulin. This leads to sustained hyperglycemia (high blood sugar), which can be linked to long-term vascular complications and other related health issues such as cardiovascular diseases, neuropathy, retinopathy, and nephropathy.

Importance of Managing T2DM

Prevention and effective management of T2DM is urgently needed as it is associated with a multitude of health complications including cardiovascular disease, renal disease, blindness, lower-limb amputations, cancer, depression, anxiety and other psychiatric disorders. An increase in high-fat and high-sugar diets combined with physical inactivity have contributed to the increased prevalence of T2DM, along with an ever-ascending prevalence of obesity. Prevalence of T2DM is higher in African Americans, Hispanics and other ethnic minorities than in the white population due to complex interactions between genetics, access, culture and education and healthy living habits.

Pathogenesis of T2DM

The pathogenesis of T2DM is multifactorial and likely consists of a combination of genetic predisposition and environmental factors that culminate in reduced glucose tolerance. T2DM is defined by a reduced ability of insulin to stimulate glucose uptake in peripheral tissues, namely muscle, adipose tissue and the liver. This reduced insulin sensitivity is commonly associated with obesity. It is particularly associated with visceral adiposity, whose altered

metabolic profile is characterized by increased free fatty acids, pro-inflammatory cytokine, adipokines and other factors, all interfering with insulin signaling and reducing its sensitivity.

Insulin resistance can be attributed to defects in the insulin signaling cascade, notably the downregulation of IRS proteins and inhibition of inositol-3-kinase (PI3K) pathway. Together, these mechanisms decrease the transport of glucose into cells and lead to hepatic glucose production, which magnifies the hyperglycemia.

β -cell dysfunction plays a key role in the etiology and progression of T2DM. Chronic hyperglycemia, high free fatty acids and oxidative stress impair the function of pancreatic β -cells, the cells responsible to produce insulin. These factors lead to a decline in the expression of insulin gene, β -cell mass and decrease in insulin secretion, resulting in the progression of the disease. The increase in the number of lost β -cells contributes to amyloid deposits in the pancreas, which continue to contribute to the death of these cells and further reduce the production of insulin.

The Gut's Role in Diabetes

Although the human gut has long been understood to be an essential organ for nutrition absorption and digestion, it was not until the late 20th century that scientists fully understood the impact of gut bacteria on general health. The human gut is populated with trillions of microorganisms constituting the gut microbiota, which plays an important role in metabolic processes associated with glucose metabolism, lipid metabolism and energy homeostasis. Although studies as early as the 1960s suggested that gut bacteria may play a larger role in metabolic processes, historical research has mainly concentrated on harmful bacteria that cause diseases. With the development of sophisticated genomic tools, more recent studies have underscored the importance of gut microbiota dysbiosis in the etiology of T2DM.

Dysbiosis is a change in the normal composition of the microbiome. It may enhance insulin resistance and contribute to T2DM. Notably, studies have demonstrated that individuals with T2DM have a unique gut microbial composition when compared with lean healthy controls, showing an increase in opportunistic pathogens such as *Bacteroides* and *Prevotella* and a decrease in BIF. Furthermore, alterations in microbiota composition are associated with 'leaky gut', manifesting as enhanced intestinal permeability that leads to translocation of lipopolysaccharides (LPS) derived from the cell wall of Gram-negative bacteria into the systemic circulation. LPS instigates chronic low-grade systemic inflammation by interacting with Toll-like receptor 4 (TLR4) on immune cells. Consistently, TLR4 signals play a pivotal role in promoting insulin resistance and T2DM. The gut microbiota also impacts production of SCFA, which includes butyrate, propionate and acetate. SCFA have been demonstrated to suppress glucose metabolism and insulin sensitivity. Falling SCFAs-producing bacteria in T2DM is one factor that worsens insulin resistance.

Lifestyle interventions continue to be the cornerstone of T2DM treatment. Moderate weight loss, by changing the diet and increasing physical activity, has been shown to result in improved insulin sensitivity and improved glycemic control. A well-balanced diet with adequate

intake of whole grains, fruits and vegetables, and lean proteins – such as fish, skinless poultry and legumes – with limited refined carbohydrates and sugars is recommended. Regular physical activity with both aerobic and resistance exercise is recommended to improve insulin sensitivity and cardiovascular risk factors.

The Link Between T2DM and Periodontitis

The American Academy of Periodontology and the American Diabetes Association report that people with diabetes are twice as likely to develop periodontal disease compared to those without diabetes [3]. This relationship is a major public health concern because of the high global prevalence of both conditions. Additionally, according to a joint report by the International Diabetes Federation and the European Federation of Periodontology, it is estimated that up to 85% of people with diabetes will experience some form of periodontal disease during their lifetime [3]. This illustrates the significant overlap between the two diseases and their combined impact on global health.

These statistics underscore the importance of managing both conditions together due to their interconnectedness and widespread impact. This reciprocal relationship has been shown to be due to a complex interaction of pathways, such as the immune response, microbiology, inflammation and metabolic control.

Diabetes and Its Impact on Periodontal Disease

T2DM in particular, is a major risk factor for the presence and progression of periodontal disease. The persistent state of high blood sugar in T2DM, results in the accumulation of advanced glycation end products (AGEs). AGEs bind to receptors (RAGEs) present on several cell types including macrophages, endothelial cells and fibroblasts to stimulate the release of cytokines including tumor necrosis factor-alpha (TNF- α), interleukin-6 (IL-6) and other mediators that contribute to an exaggerated host inflammatory response in the periodontal tissues.

Elevated levels of glucose in the blood also result in a complex change in the subgingival environment favoring the growth of pathobionts such as *Porphyromonas gingivalis*, *Tannerella forsythia*, and *Treponema denticola*, collectively called the red complex. This is a group of bacteria strongly associated with periodontal disease whose hyperglycemic environment is conducive for their growth, as well as potency. The infection produced by these bacteria contribute to the accumulation of inflammatory cells around the roots of the teeth.

Neutrophils are the first line of defense against infections but their function is attenuated in diabetes. Neutrophils from diabetic subjects show reduced chemotaxis, phagocytosis and microbial killing that lead to an increased bacterial burden and periodontal destruction. The hyperglycemic environment results in suppression of collagen synthesis and an increase in collagenase resulting in a skewed collagen metabolism. This can lead to diminished structural integrity of the periodontal tissues that are more prone to bacterial penetration leading to deeper periodontal pockets, higher attachment loss and more rapid bone resorption.

Periodontal Disease and Its Impact on Diabetes

While diabetes worsens periodontal disease, periodontal disease also worsens glycemic control in diabetes patients. Periodontal disease is a chronic inflammatory disease characterized by a systematic release of inflammatory mediators into the systemic circulation, including C-reactive protein, TNF- α and IL-6. These inflammatory mediators exacerbate insulin resistance, a key feature of type 2 diabetes, by impairing insulin signaling pathways. For example, TNF- α phosphorylates serine residues on the signaling molecule known as the insulin receptor substrate-1, which then inhibits the action of insulin in the reduction of blood glucose levels.

In addition, chronic inflammation from periodontal disease may increase the demand for insulin, which may further complicate glycemic control. Inflammatory cytokines stimulate hepatic glucose production and impair glucose uptake by peripheral tissues, both of which contribute to hyperglycemia. It thus creates a vicious cycle in which poor glycemic control worsens periodontal disease, and periodontal disease also worsens glycemic control.

Microbiological Mechanisms Linking Diabetes and Periodontal Disease

The microbiological mechanisms linking diabetes and oral diseases like periodontitis are complex, and are believed to operate in a bidirectional manner. The altered subgingival microbiota of individuals with diabetes is one of the key factors at play. The hyperglycemic environment in diabetic individuals creates an inhospitable environment for health-promoting microbes and a ‘dysbiotic’ shift in the microbial community composition favors more virulent and pathogenic species.

High levels of *P. gingivalis*, *T. forsythia*, and *A. actinomycetemcomitans* – species associated with severe forms of periodontal disease – have been measured in diabetic individuals. *P. gingivalis* has emerged as a key player in the pathogenesis of periodontitis. It can evade the host immune response by suppressing the expression of antigen-presenting molecules such as major histocompatibility complex class I and II, and immunomodulatory host inflammatory pathways by suppressing the cellular response to lipopolysaccharides. Its signature virulence factor is the cysteine protease gingipain, which degrades host proteins and triggers the immune response.

Gingipains can degrade interleukin beta (IL-1 β) and tumor necrosis factor alpha (TNF- α), two key cytokines signaling the development of immune cells, and thereby reduce their ability to signal an effective immune response. However, gingipains can also activate complement pathways and induce the release of other pro-inflammatory mediators. In short, this microbial protease has a dual role by exerting anti-inflammatory effects along with mediating chronic inflammation and tissue damage. It is known that, in diabetes, the dysregulation of the immune response and the hyperglycemic environment can create a pro-inflammatory environment in which *P. gingivalis* and other pathogens can thrive.

Oral infection with *P. gingivalis* leads to increased tissue destruction and bone loss, and now it appears that this microbe could be involved in exacerbating periodontal disease in individuals with diabetes. *P. gingivalis* produces lipopolysaccharides and other endotoxins that

can elude the host immune response and enter the bloodstream to affect other organs. Indeed, evidence is emerging linking lipopolysaccharides from *P gingivalis* to an increased incidence of cardiovascular disease, and also to diabetic complications, including diabetic retinopathy, nephropathy and neuropathy.

Another microbiological mechanism linking diabetes and periodontal disease pertains to the formation of microbial biofilms. These are complex communities of bacteria embedded in an extracellular matrix that form on surfaces. In the oral cavity, they form on teeth and support tissues. This biofilm environment contributes to the severity of the chronic periodontal lesion and its tendency to persist. In diabetic individuals, the altered subgingival environment – namely an elevated glucose level and impaired immune responses – has been shown to create an environment ripe for the formation of more virulent or more resistant biofilms, which are more resistant to host immune responses and antimicrobial treatments. Periodontal disease is particularly difficult to manage in diabetic individuals, where these biofilms complicate the risk of infection [2].

Systemic Implications and the Role of Inflammation

The systemic impact of the link between diabetes and periodontal disease is especially relevant because chronic inflammation underpins both conditions. In diabetes, chronic inflammation plays a causal role in many of the long term complications including cardiovascular disease, nephropathy and retinopathy. Periodontal disease is also associated with an increased risk of systemic disease, including cardiovascular disease, stroke and adverse pregnancy outcomes. Chronic inflammation associated with periodontal disease can promote such systemic complications in diabetes by exacerbating a pro-inflammatory state throughout the body which increases arterial stiffness and can lead to tissue damage.

Inflammatory mediators released from periodontal tissues can directly enter the systemic circulation, directly impacting the integrity of the endothelial lining of blood vessels. This increases the likelihood of damaging atherosclerotic plaques and can also promote endothelial dysfunction, increased oxidative stress and the development of atherosclerotic plaques.

This increases the risk of cardiovascular events, but can also affect the management of diabetes because it can increase insulin resistance and exacerbate glycemic control. Inflammatory mediators associated with periodontal disease can also impact upon other diabetic complications directly. For example, the increased inflammatory load can increase the risk of diabetic nephropathy by promoting glomerular inflammation and fibrosis. Similarly, chronic inflammation can promote diabetic retinopathy by increasing levels of vascular permeability leading to formation of new, fragile retinal blood vessels.

Figure 4 - Schematic representation of how inflammatory mechanisms link periodontitis to cardiovascular diseases. An imbalance in the pathogens present in the biofilm causes inflammation in the gingival epithelium (1). This inflammation triggers the release of chemical mediators such as interleukins, prostaglandin E2, tumor necrosis factor alpha, and matrix metalloproteinases, which attract immune cells. This inflammatory response leads to the reabsorption of alveolar bone by osteoclasts. Over time, the chronic spread of oral pathogens into the bloodstream (2) can contribute to the development of CVDs (3), including atherosclerosis, myocardial infarction, and peripheral artery disease [5].

The relationship between diabetes and periodontal disease is complex, bidirectional, and mediated by microbiological, immunological and inflammatory pathogenesis. At the same time, diabetes increases the inflammatory response to periodontal disease and accelerates the loss of periodontal attachment, while also altering the subgingival microbiota and impairing immune function. Periodontal disease increases systemic inflammation and contributes to insulin resistance and poor glycemic control in patients with diabetes. Thus, understanding these mechanisms is critical to developing rational therapies to treat both conditions and improve the overall health of patients with diabetes. Understanding the complexity of these mechanisms underscores the need for integrative care to prevent and treat both diabetes and periodontal disease. Periodontal assessment should be part of routine diabetes management, and improved glycemic control should be accompanied by effective periodontal treatment to break the cycle of inflammation and risk for disease progression.

Lifestyle interventions continue to be the cornerstone of T2DM treatment. Moderate weight loss, by changing the diet and increasing physical activity, has been shown to result in improved insulin sensitivity and improved glycemic control. A well-balanced diet with adequate intake of whole grains, fruits and vegetables, and lean proteins such as fish, skinless poultry and

legumes, with limited refined carbohydrates and sugars, is recommended. Regular physical activity with both aerobic and resistance exercise is recommended to improve insulin sensitivity and cardiovascular risk factors.

The management of T2DM inevitably requires a multidisciplinary approach and incorporates lifestyle modifications, drug therapy and, in some cases, surgical interventions to achieve the best glycemic control, prevent complications and reduce the overall risk of the disease. As T2DM is managed, the risks of progressing periodontal disease are lessened and the negative effects may be avoided.

Conclusion

The quality of the articles reviewed was consistently high, with thorough methodologies and clear reporting of results. Many studies employed well-structured designs, such as longitudinal or randomized controlled trials, ensuring reliability. Additionally, the consistency across multiple studies in linking glycemic control with periodontal health further strengthens the evidence. The use of standardized diagnostic criteria and appropriate controls in these articles further enhanced their credibility as valuable sources of information on the subject.

The bidirectional relationship between periodontal disease and T2DM underscores the need for a holistic approach to managing both conditions. Both diseases share inflammatory pathways and are influenced by a dysbiotic microbiome, emphasizing the critical importance of integrated care that targets both oral and systemic health. Addressing periodontal disease has been shown to enhance glycemic control, potentially reducing the risk of diabetes-related complications. Conversely, effective glycemic management can alleviate the severity of periodontal disease, improving oral health outcomes and overall quality of life for these patients.

As the global prevalence of both conditions rises, the healthcare system must adapt by incorporating routine periodontal screenings into diabetes management protocols. This will ensure comprehensive care that addresses the complex interplay between these chronic conditions. Collaborative efforts between dental and medical professionals are essential for improving patient outcomes and lessening the public health burden associated with these diseases.

Future research should focus on developing novel treatment modalities that simultaneously address both periodontal disease and diabetes. Studies exploring the impact of microbiome-targeted therapies, anti-inflammatory treatments, and patient-specific care strategies will be particularly valuable. Furthermore, research into practical implementation strategies, such as integrating periodontal evaluations into standard diabetic care frameworks and developing interprofessional training programs, is needed to make such approaches feasible in everyday clinical practice.

A Review of the Cosmic Microwave Background (CMB) and Inflation Theory

By Audrey Horn

Abstract

I review the theory and observations of the Cosmic Microwave Background (CMB) and its crucial role in supporting and testing inflation theory. Inflation was introduced to address three major issues in the classical Big Bang model: the horizon problem, the flatness problem, and the monopole problem. The predictions made by inflation theory are consistent with observations of the CMB, particularly its uniformity, tiny temperature fluctuations, and flatness. However, this consistency does not provide direct proof of inflation. A potential direct signature of inflation would be the detection of B-mode polarization in the CMB, specifically caused by primordial gravitational waves generated during the inflationary epoch. These B-modes are extremely faint signals, making them challenging to detect. To overcome this, new generations of highly sensitive instruments designed to operate at millimeter wavelengths are currently under development, with the goal of detecting these elusive signals and providing stronger evidence for inflation.

1. Introduction

The Hot Big Bang theory, initially proposed by Gamow, Alpher and Herman in 1948, is the prevailing cosmological model that explains the earliest known periods of the universe (Gamow, 1948; Alpher & Herman, 1948). It posits that the universe began as an extremely hot and dense state—often referred to as a singularity—approximately 13.8 billion years ago and has been expanding ever since. While the Big Bang theory describes the overall expansion and cooling of the universe, the theory of cosmic inflation accounts for the initial conditions that led to its large-scale structure and the observed uniformity.

Inflation theory was introduced to address several unresolved issues within the classical Big Bang model, such as the horizon problem, the flatness problem, and the monopole problem (Keating, 2021). Inflation refers to a brief period of extremely rapid exponential expansion of the universe, which occurred 10^{-36} s after the Big Bang (Sutter, 2018). The theory finds strong support in observations of the Cosmic Microwave Background (CMB), which is the afterglow radiation from the early universe. The CMB offers a snapshot of the universe approximately 380,000 years after its inception, providing key insights into its composition and structure.

The detailed study of the CMB has become a critical tool in cosmology, enabling scientists to infer the universe's large-scale structure, composition, and evolution. Observations of the CMB have not only confirmed the Big Bang theory but also provided evidence for inflation, helped determine the age of the universe, and confirmed the existence of dark matter and dark energy (Vazquez et al., 2020; Olive & Peacock, 2013).

This paper will present a scientific overview of inflation theory, including its predictions for blackbody radiation, temperature anisotropies, and CMB polarization. It will also cover the

observational study of the CMB, including its accidental discovery, major space missions, and ground-based telescopes dedicated to its investigation.

2. Inflation Theory

The theory of inflation in cosmology, first suggested by Alan Guth in 1981, suggests a period of rapid, exponential expansion of space in the early universe shortly after the Big Bang (Guth, 1981; Linde, 1982). This theory has undergone continuous revision and fine tuning to address the problems associated with the standard big bang model (Albrecht & Steinhardt, 1982; Guth, 2014; Linde, 2015).

The inflationary epoch is theorized to have lasted from approximately 10^{-36} seconds to between 10^{-33} and 10^{-32} seconds after the Big Bang. During this brief period, the universe expanded by an estimated factor of 10^{26} times its original size over a mere 10^{-32} seconds (Sutter, 2018). This immense expansion is thought to have laid the groundwork for the large-scale structures—galaxies, clusters, and superclusters—that we observe in the universe today. During this time, the contents of the universe were sent flying apart at extremely high velocities, overcoming the mutual gravitational forces between cosmic objects and causing rapid expansion. While the universe continues to expand today driven by dark energy, the rate of expansion is significantly slower than during the inflationary period (Vazquez et al., 2020; Olive & Peacock, 2013).

Inflation theory explains the origin of large-scale structure in the cosmos: small quantum fluctuations during the inflationary phase were stretched to macroscopic scales, seeding the formation of galaxies and other cosmic structures. These fluctuations also account for why the universe appears isotropic—uniform in all directions—and why it exhibits a flat geometry. Furthermore, inflation accounts for the even distribution of the cosmic microwave background (CMB) radiation, the oldest observable light in the universe.

The inflationary theory addresses three key problems in cosmology: the monopole problem, the horizon problem, and the flatness problem. A detailed review of these issues is presented below.

The Monopole Problem

A magnetic monopole is a hypothetical elementary particle that has only a single magnetic pole, either north or south, unlike a typical magnet, which has both poles. The Grand Unified Theory (GUT) suggests that at extremely high energies, during a period known as grand unification, the electromagnetic, weak, and strong nuclear forces were combined into a single force. According to GUT, magnetic monopoles should have been produced in large quantities during the early stages of the universe (Albrecht & Steinhardt, 1982).

Under the standard Big Bang model, these monopoles should still exist today and be detectable. However, despite extensive searches, no magnetic monopoles have been observed, leading to what is known as the monopole problem (Rajantie, 2016).

Inflation theory offers a solution to this problem. It proposes that during the brief period of rapid exponential expansion, known as inflation, the universe expanded so quickly that the density of magnetic monopoles was drastically reduced. This rapid expansion diluted the monopoles to such an extent that their current concentration in the universe is extremely low, thereby reducing the statistical likelihood of detecting them today (Guth & Tye, 1980).

The Horizon Problem

In our current universe, we observe a background temperature of about 2.7 Kelvin from the cosmic microwave background (CMB). This measurement is isotropic, meaning that it is nearly uniform in every direction across the sky. However, this uniformity leads to what is known as the horizon problem. According to the standard Big Bang model, different regions of the universe should not have the same temperature because they are separated by vast distances and have not had enough time since the universe's inception to exchange light or heat. In other words, these regions are causally disconnected, meaning they could not have influenced each other to reach thermal equilibrium. The fact that we observe a nearly uniform CMB temperature everywhere is a puzzle because, in theory, regions of space that are so far apart should have had vastly different conditions.

Inflation theory provides a solution to the horizon problem (Guth, 1981). The extremely rapid, exponential expansion during this inflationary phase would have stretched out any initial irregularities and caused regions that were once close together and in thermal contact to be pushed far apart. As a result, even regions that are now billions of light-years away from each other were once close enough to reach the same temperature, which explains the uniformity of the CMB we observe today.

The Flatness Problem

The flatness problem is a fundamental issue in cosmology that concerns the shape and geometry of the universe (Guth, 1981; Vázquez et al., 2020). The relative density of matter and energy in the universe is represented by the symbol Ω (Omega). The value of Ω determines the curvature of the universe: If $\Omega < 1$, the universe has a saddle-like (open) geometry with negative curvature. If $\Omega > 1$, the universe has a spherical (closed) geometry with positive curvature. If $\Omega = 1$, the universe is flat, with zero curvature.

Current observations show that the universe's density is very close to this critical value of $\Omega = 1$, suggesting that the universe is nearly flat. However, this presents a dilemma because, in the early universe, Ω would need to have been even closer to 1—by an incredibly precise margin—for it to remain so close to 1 today. Any tiny deviation from this critical value in the early universe would have rapidly diverged over time, resulting in either a highly curved or a collapsed universe (Vázquez et al., 2020).

This extreme fine-tuning required in the early universe is known as the flatness problem. Inflation theory offers a solution by proposing that, during a brief period of rapid exponential expansion shortly after the Big Bang, any initial curvature of the universe was stretched out,

driving Ω towards 1. This means that inflation would have naturally flattened the universe, making the observed flatness we see today an inevitable outcome (Keating, 2023).

3. The Theory and Discovery of Cosmic Microwave Background

In 1948, physicists George Gamow, Ralph Alpher, and Robert Herman developed a theoretical framework for the Big Bang. They proposed that the early universe was extremely dense and hot, dominated by radiant energy rather than matter, a period known as the “radiation era” (Alpha, 2012).

Immediately after the Big Bang, the universe was a dense plasma composed of hot plasma of particles (mostly protons, neutrons, and electrons) and photons. For the first 300,000 years, this plasma remained too hot for atoms to form. However, as the universe expanded and cooled to approximately 3000 K, conditions became suitable for recombination, the process in which protons captured free electrons to form neutral hydrogen atoms. Prior to recombination, the universe was effectively opaque to electromagnetic radiation because free electrons scattered photons via Thomson scattering, preventing light from traveling freely. Once recombination occurred, most of the free electrons were bound into hydrogen atoms, reducing photon scattering significantly. This transition made the universe transparent to photons, allowing them to travel freely through space. This decoupling of photons from matter resulted in the release of the cosmic microwave background (CMB), the afterglow radiation that we observe today as a nearly uniform temperature of about 2.7 K across the universe (ESA, 2024).

However, the experimental confirmation of the theoretical prediction of CMB took more than a decade. In 1964, the Cosmic Microwave Background (CMB) was first observed by Arno A. Penzias and Robert W. Wilson (Penzias & Wilson, 1964). The two were working at the Bell Telephone Laboratories in New Jersey when they detected a faint background static that would not fade regardless of where they pointed the antenna of their horn-shaped detector. The only purpose of their work was to try and detect microwave radio emissions from the Milky Way, but instead, they had discovered the CMB. Robert H. Dicke, a Princeton physicist, had proposed that the leftover radiation from the Big Bang should still be present in the universe at a value of 10 Kelvin. Once he had heard about what Penzias and Wilson had discovered, Robert Dicke immediately knew that the discovery confirmed the existence of CMB (Evans, 2015).

Originally, the radiation emitted during recombination had much higher energy at a higher temperature than today, estimated to be about 3000K. However, as the universe expanded, this light wavelength stretched significantly due to redshift, lowering its frequency and energy until it reached the microwave range, corresponding to a temperature of about 2.7 Kelvin as observed today (Fixen, 2009). Since the onset of recombination at 3000K, the universe has expanded over a period corresponding to a redshift of about 1100. That is, the expansion of the universe has “cooled” the light (ESA, 2024).

Precision measurement of CMB is essential to validate and advance the cosmological model. Both space missions and ground based telescopes have contributed to the CMB study. While the space-based missions established broad CMB properties, the newer, ground-based

telescopes delve deeper into small-scale structures, aiming to uncover more detailed and nuanced aspects of the early universe's evolution.

4. Space Missions for CMB

To investigate the cosmic microwave background of the universe and provide data for the cosmology research, a series of space missions were launched (Siddiqi, 2018). The RELIKT-1 satellite first launched in 1983 provided early confirmation of CMB existence and detected small anisotropies (temperature fluctuations) in the CMB, though its resolution was limited (Klypin, 1992; Strukov et al., 1992). Afterwards, three major missions have contributed to the progress of making full-sky measurements: Cosmic Background Explorer (COBE) launched in 1989, Wilkinson Microwave Anisotropy Probe (WMAP) launched in 2001, and Planck launched in 2009 (NASA, 2024; Siddiqi, 2018). These missions successively improved the precision and detail of CMB maps. COBE laid the groundwork by confirming the CMB's blackbody spectrum and detecting anisotropies. WMAP provided more detailed maps of the CMB, refining cosmological parameters. Planck delivered the most precise measurements of the CMB, offering high-resolution maps and further insights into the early universe.

COBE was active from 1989 to 1993 and its main goal was to map out the CMB and gain measurements that could help us better understand the universe (Siddiqi, 2018; Beggess et al, 1992). It was originally supposed to run for 6 months, but instead COBE was able to function for 4 years, 1 month and 4 days. Three key instruments on board of the satellite were the Differential Microwave Radiometer (DMR), the Diffuse Infrared Background Experiment (DIRBE), and the Far-InfraRed Absolute Spectrophotometer (FIRAS). These instruments helped discover that the CMB has an almost perfect blackbody spectrum and that it additionally has faint anisotropies (Dwek, 1998). The two principal scientists behind the making of the satellite were John C. Mather and George F. Smoot, both earning the 2006 Nobel Prize in Physics due to their work on COBE vitalizing the field of cosmology through the satellite's major discoveries (The Royal Swedish Academy of Sciences, 2006).

WMAP was launched by NASA at the end of June 2001 and was placed in orbit at the Lagrangian point L2. It operated from 2001 to 2010 measuring the fluctuations in the temperature of the CMB (Siddiqi, 2018). WMAP produced skymap data with 45 times the sensitivity and 33 times the angular resolution of COBE. The WMAP satellite contributed to the establishment of the current Standard Model of Cosmology: the Lambda-CDM model, the Lambda-CDM model lambda cold dark matter, or denoted as Λ CDM model. This prevailing cosmological model describes the evolution of the universe from the earliest moments after the Big Bang to the present day. The model incorporates the theory of cosmic inflation, the Big Bang nucleosynthesis, and the structure formation, and it is well-supported by a wide range of astronomical observations, including CMB, the distribution of galaxies, and the Type Ia supernovae data (Bennett et al, 2013).

According to data gathered by WMAP, the universe should be dominated by dark energy as a constant. It also calculated the age of the universe to be 13.772 ± 0.059 billion years and the

hubble constant to be 69.32 ± 0.80 km/s/Mpc. It was also able to determine the universe composition of baryonic matter, dark matter and dark energy, a cosmic neutrino background with an effective number of neutrino species of 3.26 ± 0.35 , and a flat universe with the curvature $\Omega_k = -0.0027$ (Bennett et al, 2013).

Planck was an ESA space observatory launched in mid-May of 2009, dedicated to studying the early Universe and its subsequent evolution. Planck had a resolution more than 2.5 times that of WMAP and it has created the sharpest all-sky map of CMB. Planck validated WMAP results and provided the measurement of fundamental universe properties with higher accuracy and precision, such as the Hubble constant, the age of the universe, the density and distribution of matter in the Universe. The finding proved the standard model of cosmology beyond doubt (Planck Collaboration, 2016).

From COBE to WMAP, and to Planck, each newer satellite was developed with improved frequency coverage, polarization sensitivity, and higher spatial resolution and signal-to-noise. The measurement improvement from COBE, to WMAP and Planck is shown in Figure 1 (NASA, 2024). As we look from left to right, we are able to tell that the image of the CMB becomes clearer with better defined features compared to the previous one. This is a reflection of the quality and technology of the satellites improving, suggesting that if we were to build another CMB satellite, the image of the radiation would have even better resolution with more exact info about the size and placement of the anisotropies.

Figure 1. A comparison of the observed CMB between the three satellites, showing 10-square-degree patches of all-sky maps from DMR (Differential Microwave Radiometer). The anisotropies in CMB encode cosmological information and provide a unique probe of the early universe when the first stars and galaxies formed. Sourced from NASA. Image Credit: NASA/JPL-Caltech/ESA.

To understand the CMB data, we need to review the blackbody radiation model, discuss polarization, the power spectrum, and spherical harmonics, which are all interconnected in the study of cosmology. The polarization of the CMB, particularly the E-mode and B-mode patterns, encodes information about the primordial density fluctuations and potential gravitational waves from inflation. The power spectrum is derived from the CMB data using spherical harmonics and is used to analyze the temperature fluctuations and polarization patterns, offering a window into the physics of the early universe and testing the predictions of the Big Bang and inflationary models.

Blackbody Radiation

The CMB is observed to have the characteristics of black body radiation, which is consistent with the prediction from the Big Bang model. Black body radiation is the emission of electromagnetic energy from an idealized object that absorbs all incident radiation, at a characteristic spectrum dependent on its temperature. A black body in physics is an idealized object that absorbs all radiation incident upon it and reflects none. It also emits radiation in a characteristic spectrum that depends only on its temperature. The spectrum of the CMB is incredibly close to that of an ideal black body, with a peak wavelength in the microwave region, which corresponds to a temperature of about 2.73 Kelvin (Fixen, 2009).

CMB Temperature Anisotropies

While the CMB is remarkably uniform, with an average temperature of about 2.73 Kelvin, it exhibits tiny fluctuations on the order of one part in 100,000, also dubbed as on the order of micro Kelvin. The term "micro Kelvin" is often used in the context of very small temperature differences or variations, such as those observed in the Cosmic Microwave Background (CMB). The COBE mission gave a precise measurement of blackbody temperature and clearly confirmed the temperature anisotropy with the Differential Microwave Radiometer instrument (Smoot et al., 1992). The ability to map CMB to the micro Kelvin precision is critical to the analysis of temperature anisotropy.

Temperature anisotropies (temperature fluctuations) in the context of the CMB refers to the small variations in temperature observed across the sky (Sugiyama, 2014). These tiny differences in temperature across the sky are believed to have originated from quantum fluctuations in the early universe that were stretched to macroscopic scales during cosmic inflation. They provide a snapshot of the universe just 380,000 years after the Big Bang and are crucial for understanding the structure and evolution of the cosmos. These anisotropies reflect underlying density fluctuations in the early universe, which eventually led to the formation of all the large-scale structures we see today, such as galaxies and clusters of galaxies, and superclusters (Hu & Dodelson, 2002).

These fluctuations are studied through the CMB's angular power spectrum, a crucial tool in cosmology used to quantify these temperature anisotropies. The angular power spectrum as shown in Figure 2 plots the magnitude of these temperature fluctuations against their angular size

in the sky (ESA, 2013). It is a way to describe the distribution of power or variance in a signal, particularly in the context of the CMB radiation, over different angular scales in the sky. It essentially tells us how much structure or fluctuation there is at various scales of observation. The angular power spectrum is typically plotted with the magnitude of the temperature fluctuations (that is, power) on the y axis and the multipole moment on the x-axis, which is a measure of the fluctuation scale, and the magnitude of the temperature fluctuations on the y-axis. The multipole moment (ℓ) is inversely related to the angular scale, with low (ℓ) corresponding to large patch sizes observed of the CMB in the sky (wide angles) and high (ℓ) to small patch sizes in the sky (narrow angles).

Figure 2. Planck Power Spectrum shows the temperature fluctuations in the Cosmic Microwave Background detected at different angular scales in the sky. Sourced from the European Space Agency (2013).

The power spectrum reveals a series of peaks and troughs that correspond to the scales of acoustic oscillations in the early universe, providing insights into the physics of the Big Bang and inflation. These peaks result from acoustic oscillations in the primordial plasma of the early universe, where pressure from photons (radiation) competed against the gravitational pull of matter (baryons and dark matter). The oscillations led to regions of compression and rarefaction that left imprints on the CMB as it was released.

In Figure 2, we notice three major peaks on the left with small peaks gradually vanishing on the right. The first three peaks in the angular power spectrum by Planck are of particular interest, which actually agrees well with theoretical modeling containing info on the geometry of the universe, the baryon density, and the total density of non relativistic matter (Hu & White, 2004).

The first peak (Doppler Peak) corresponds to the largest scale at which acoustic oscillations could have occurred in the primordial plasma. It indicates the scale of the sound horizon at the time of recombination when photons decoupled from baryons. The height and location of the first peak provide information about the curvature of the universe and the density of baryonic matter. The second peak provides information about the density of baryons in the universe. The relative height of the second peak to the first peak is sensitive to the baryon-to-photon ratio. A higher baryon density enhances the second peak relative to the first. The third peak offers insights into the amount of cold dark matter in the universe. The third peak's relative height compared to the first two peaks helps to constrain the density of cold dark matter, as dark matter's gravitational influence affects the amplitude of the oscillations (Hu et al., 2002; Hu & White, 2004).

The precise measurement of these peaks has been instrumental in determining the universe's composition, including the relative amounts of dark matter, dark energy, and baryonic matter. It has also confirmed the flatness of the universe and provided strong evidence for the standard Lambda-CDM model of cosmology (Hu et al., 2002; Page et al., 2007).

CMB Polarization.

A small fraction of the CMB is polarized, vibrating in a preferred direction (Kovac et al., 2002). Polarization is a property of light that describes the orientation of its electric field. This CMB polarization is caused by Thomson scattering from free electrons of a radiation field with a local quadrupole moment just before the recombination of electrons with protons. As this occurred just before photons decoupled from matter and started traveling freely through space, the polarization of the CMB directly probes the dynamics at the epoch of decoupling and encodes information about the distribution of matter in the early universe. In the context of the Cosmic Microwave Background (CMB), "E-mode" and "B-mode" refer to two distinct patterns of polarization observed in the CMB radiation. They are named after their mathematical properties, which resemble the electric (E) and magnetic (B) field patterns, respectively.

E-modes (Electric-type modes)

E-modes are a curl-free pattern of polarization, analogous to the electric field lines around a charged object (hence the name "Electric-type"). They are the dominant polarization pattern in the CMB and were first detected in 2002 (Kovac et al., 2002). E-modes are generated by scalar perturbations, which are density fluctuations in the early universe that also give rise to the temperature anisotropies in the CMB. Specifically, E-mode polarization is generated by velocity gradients in the photon-baryon fluid. When photons scatter off electrons at the surface of last scattering, the local velocity of the fluid (due to the acoustic oscillations) can induce a linear polarization pattern in the scattered light. The detection and measurement of E-mode polarization serve as an independent confirmation of the standard cosmological model, particularly the Lambda-CDM model (Hu et al., 2002). By analyzing the E-mode polarization, cosmologists can better understand the initial conditions and physical processes that eventually

resulted in the large-scale structure we observe in the universe today. Inflation predicts specific polarization patterns that match the E-modes observed by satellites like Planck (Planck Collaboration, 2016).

B-modes (Magnetic-type modes)

B-modes are a divergence-free pattern of polarization that have a swirling, curl-like pattern, similar to the magnetic field lines around a bar magnet (hence the name "Magnetic-type"). B-modes are much fainter than E-modes and are more challenging to detect. There are two types of B-mode mechanisms: gravitational lensing and primordial gravitational waves.

The first detection of B-modes from gravitational lensing was announced in 2013 (Reich, 2013). Gravitational Lensing of CMB occurs when light from the CMB is slightly distorted as it passes through the gravitational fields of massive objects like dark matter structures, galaxies and galaxy clusters. This lensing effect can convert some E-modes into B-modes, creating a secondary B-mode signal.

Studying these lensing-induced B-modes can help map the distribution of dark matter, better understand the large-scale structure of the universe, and refine measurements of cosmological parameters like the Hubble constant and the universe's total matter content. Thus, gravitational lensing B-modes are a powerful tool for mapping the cosmos and understanding its evolution.

Primordial B-modes remain a theoretical prediction and are one of the most sought-after signals in modern cosmology (Kamionkowski & Kovetz, 2016; Carlstrom et al., 2011). According to inflation theory, the rapid expansion of the universe just after the Big Bang generated a background of primordial gravitational waves. These gravitational waves would have left a unique imprint on the CMB in the form of B-mode polarization. Detecting primordial B-modes would not only confirm a key prediction of inflation but also provide a direct window into the physics of the early universe at extremely high energies, potentially close to the Grand Unified Theory (GUT) scale. If observed, these primordial B-modes could offer evidence of gravitational waves from the inflationary epoch, giving us a glimpse into conditions that existed just fractions of a second after the Big Bang.

However, detecting primordial B-modes is extremely challenging due to their faintness and the presence of foreground noise, such as galactic dust and the overlapping signal from lensing-induced B-modes. Current research is focused on improving the sensitivity of detectors to distinguish primordial B-modes from these sources of noise. Upcoming experiments like the Simons Observatory and CMB-S4 are designed with enhanced sensitivity and precision to search for these primordial B-modes. These experiments aim to push the boundaries of our understanding of the early universe and could potentially provide the first direct evidence of cosmic inflation.

Relationship between E- mode and B-Mode

E-modes and B-modes are related through the process of gravitational lensing (The Polarbear Collaboration, 2014). As CMB photons pass through the gravitational potential wells of large-scale structures, E-modes can be subtly distorted, creating B-modes. The relationship between E-modes and B-modes is also evident in their power spectra as seen in Figure 3. While E-modes are directly related to temperature anisotropies, B-modes have a distinct power spectrum that, if detected at large angular scales, could confirm the presence of primordial gravitational waves. Both E-modes and B-modes carry information about the early universe, but they arise from different physical mechanisms and probe different aspects of the universe's history. E-modes help us understand the conditions right after recombination, while B-modes from primordial gravitational waves would provide a window into the universe's inflationary period.

Figure 3. E-mode and B-mode Power Spectrum. Sourced from Baumann et al. (2009).

5. Ground-Based Observatories

Researchers continue to work on the new generation of Cosmic Microwave Background (CMB) telescopes that are aimed to improve upon the sensitivity, resolution, and range of previous CMB observations. These advancements will enable more precise measurements of the CMB's temperature and polarization, providing deeper insights into the early universe, cosmic inflation, and the fundamental physics that govern the cosmos. While the satellite missions are better suited for large-scale, full-sky observations, providing a global view of the early universe, ground based telescopes zoom in on smaller regions to provide detailed insights into small-scale fluctuations and cosmic structures. These ground based telescopes are designed to study finer-scale CMB features, such as gravitational lensing and polarization, which provide insights into dark matter, dark energy, and potential signals from cosmic inflation. This section will

review the ground-based observatories like the South Pole Telescope (SPT), Simons Observatory, and the upcoming CMB-S4, which focus on smaller, targeted areas of the sky.

The SPT has been operational and producing valuable data; the Simons Observatory and CMB-S4 are upcoming projects that will greatly expand the capabilities of current CMB research. The SPT collaborates with other experiments and surveys, such as the Planck satellite, to cross-validate findings and improve the overall understanding of the CMB and its implications for cosmology. The Simons Observatory will serve as a bridge between existing experiments and the more ambitious CMB-S4, which aims to be the most comprehensive CMB experiment to date. Each of these observatories will contribute unique and complementary insights into the cosmos.

South Pole Telescope (SPT)

The South Pole Telescope (SPT) is a radio telescope located at the Amundsen-Scott South Pole Station in Antarctica and it has been operational since 2007. It is designed to observe the Cosmic Microwave Background (CMB) with high sensitivity and resolution. It has a 10-meter diameter primary mirror, located at one of the best sites on Earth for millimeter-wavelength observations due to the cold, dry, and stable air (Carlstrom et al., 2011).

The SPT has been involved in several key areas of experimental work related to the CMB (Bleem et al., 2012; SPT). The SPT has produced detailed maps of the CMB, allowing for precise measurements of its temperature fluctuations and polarization. The SPT has measured the E-mode polarization of the CMB, which provides information about the density fluctuations in the early universe and helps to constrain cosmological parameters. By analyzing the distortions in the CMB caused by gravitational lensing, the SPT can study the distribution of mass, including dark matter, in the universe. The SPT has been used to detect distant galaxy clusters through the Sunyaev-Zel'dovich effect (Sunyaev & Zel'dovich, 1972), where CMB photons gain energy by scattering off hot electrons in the cluster gas. This is important for understanding the evolution of large-scale structures in the universe (Bleem et al., 2024).

Simons Observatory

The Simons Observatory (SO) has been commissioned in the Atacama Desert of northern Chile, one of the highest and driest places on Earth (The Simons Observatory, 2024). The project is a collaboration between multiple institutions and is designed to complement other CMB projects. The data collected will be shared with the broader scientific community to maximize its impact on cosmology. It is expected to be operational in mid 2020s. SO aims to complement and enhance the findings of previous CMB experiments, with a focus on polarization measurements and collaboration with other surveys (The Simons Observatory Collaboration, 2019).

SO is designed to have up to 10x the sensitivity and 5x the angular resolution of the Planck satellite. SO will measure both temperature and polarization fluctuations in the CMB to very high precision at several frequencies. The observatory consists of a large aperture (6-meter) telescope and 3 small aperture (0.5-meter) telescopes equipped with cryogenic bolometers. One

of the primary scientific goals is to detect the faint B-mode polarization pattern in the CMB via the small aperture telescopes, which could provide evidence for primordial gravitational waves and, consequently, the theory of cosmic inflation. The observatory will study the gravitational lensing of the CMB using the large aperture telescope to map the distribution of matter in the universe and to potentially shed light on the properties of neutrinos, including their mass. The Simons Observatory will also contribute to the study of galaxy clusters, and star formation (The Simons Observatory Collaboration, 2019).

CMB-S4 (Cosmic Microwave Background Stage 4)

CMB-S4 (Cosmic Microwave Background Stage 4) is the next generation ground-based CMB experiment that's currently in design and development, and is expected to begin observations in the late 2020s. It is designed to be the definitive ground-based CMB experiment, providing a legacy data set for the cosmology community and potentially making transformative discoveries about the universe. The project will deploy over 500,000 detectors across multiple telescopes, which will be located at high-altitude sites in the Atacama Desert in Chile and the South Pole, where atmospheric interference is minimal (CMB-S4, 2024).

CMB-S4 aims to be the most advanced and comprehensive survey of the CMB to date, providing high-precision measurements of CMB polarization, especially the B-mode signal, to test the inflationary theory, determine the sum of neutrino masses, and explore the nature of dark matter and dark energy. The experiment will improve constraints on the sum of the neutrino masses and may help determine the neutrino mass hierarchy by observing the effects of neutrinos on the CMB and large-scale structure. CMB-S4 will investigate the properties of dark matter and dark energy by studying their effects on the CMB, such as gravitational lensing of the CMB photons by intervening matter. It is expected to provide definitive evidence. Its comprehensive data set will likely transform our understanding of the cosmos and its underlying physical laws (Abazajian et al., 2019).

6. Conclusion

Inflation was proposed to resolve several issues with the classical Big Bang model, such as the horizon problem, flatness problem, and monopole problem. While the basic principles of inflation are well established, many of its details are still undergoing changes with the new discovery in both the theoretical and observational fronts (Linde, 2008).

The Cosmic Microwave Background (CMB) provides key observational evidence that supports the theory of cosmic inflation. The CMB is a "snapshot" of the early universe when it was about 380,000 years old, showing the state of the universe at the time of recombination. The observed properties of the CMB—uniformity, temperature fluctuations (anisotropies), geometric flatness, and polarization patterns—align closely with the predictions made by inflation theory. This strong agreement makes the CMB one of the most compelling pieces of evidence for the occurrence of inflation in the early universe.

While the CMB findings are consistent with the predictions of inflation, they do not constitute direct evidence of the theory. One of the key predictions of inflation is the generation of primordial gravitational waves, which would leave a distinct signature in the CMB called B-mode polarization. Detecting these B-modes would serve as direct evidence of inflation. However, identifying this signal is extremely challenging due to its faintness, requiring instruments with exceptional precision and sensitivity. The upcoming experiments, such as the Simons Observatory (SO) and CMB-S4, are designed to improve our detection capabilities and bring us closer to confirming this crucial aspect of inflation theory (Keating, 2023)

The field of CMB research is inherently interdisciplinary and relies on collaboration among scientists from various fields, including cosmology, astrophysics, particle physics, Observational Astronomy, Data Analysis and Statistics, and Instrumentation and Engineering. As such, CMB acts as a bridge connecting different areas of physics, allowing for a comprehensive approach to understanding the universe's origins, composition, and evolution.

In summary, the CMB is a powerful observational tool that has significantly advanced our understanding of cosmology and fundamental physics. It continues to be a focal point of intense study, with future experiments expected to yield even deeper insights into the workings of the cosmos, potentially unveiling new details about the early universe and the inflationary era.

Orientalist Imprints: The Evolution of *Alf Layla wa Layla* By Soha A. Budhani

Abstract

Alf Layla wa Layla, commonly known as *The Arabian Nights*, is an enduring series of tales emblematic of Arab culture and the Islamic faith. Though dismissed by the literary world as plebian, the original tales were popular amongst Bedouins for hundreds of years and remain ostensibly as lore (Ho 2017). With its first European revision, *Alf Layla wa Layla* was dismantled and reconstructed to appeal to the Occidental demographic. In this case, both the producer and the consumers of the publication were citizens of the world's foremost colonizers. This essay probes the background of *Alf Layla wa Layla* and its evolution in western media by focusing on the spread of orientalist images of the MENA and Islam. These stereotypes remain cemented worldwide to this day.

The MENA Region

The term "Orient" dates to the late 200s CE with the Emperor Diocletian of Rome (Wang 2021). In its original form, the term refers to the lands east of the continent, then considered Earth's center by its rulers. These lands span from North Africa to the Middle East and include South and Central Asia. Despite the various anthropologies of the vast expanse of land it encompasses, these peoples were blended into the term "orient," facilitating the one-dimensional image portrayed by colonial Western Europe. Though beyond the subject of this paper, "oriental" was generally considered a derogatory term not dissimilar to "negro," "eskimo," or "redskin," rather than a geographic distinction (Wang 2021). Stereotypes and their ramifications live on for centuries, pervading the psyche of man. Acknowledgement of the term as derogatory was officially recognized in 2016 when then President Barack Obama signed a bill officially striking the term from federal language (Fabian 2016).

The framework of Orientalism is contingent on the differentiation between the Orient and the Occident. Intellectual Edward Said pioneered a unique yet controversial stance: The West holds an outward, unapologetic bias towards the Orient (Said, *Culture* 1993). He posits that from a European mindset, the Orient is weak, enthralled by the West, "[following]... prone in his westward course" (Thoreau 1873). The Orient's failure to immediately appeal to the European standard meant it needed both European modernization and colonization to be considered a worthy albeit lesser equal which it could never be. This framework and mounting cultural assumptions led to continuous changes in *Alf Layla wa Layla* with each subsequent European translation, reflecting the mindset at that juncture.

9th Century CE: The Frame Tale

The earliest manuscript of *Alf Layla wa Layla* appeared in Baghdad in the 9th century (Abbot 1949). The handwriting on each manuscript indicates that there were multiple authors, and that the stories were compiled over several centuries (Ho 2017). These tales were retold in Arabic, a widespread language with regional dialects, under the title of *Alf Layla wa Layla*.

Preeminent Egyptian historian Ahmed Al-Maqrīzī of the Mamluk era stipulated the collection's vast relevance in the MENA through orators in the eleventh century (Chejne 1969). Prominent orators, colloquially referred to as *qassakhoun*, *maddah*, or *hakawati*, served as a powerful medium of both communication and entertainment (Huart 1903). Acting as “performer-entertainer and historian-narrator simultaneously,” these oral storytellers traveled in clans from the Arab lands of Egypt and Libya through Persia, memorizing and performing these stories with fervor (Mahir 2007). Though historical evidence is sparse, *Alf Layla wa Layla* appears to have originated in Persia under the title *Hazār Afsāna* some time prior to the 9th century. Islam being the predominant faith in the MENA region, and therefore a prominent in their stories, it is impossible to separate either the original *Alf Layla wa Layla* or today's *The Arabian Nights* from Islam. This is especially due to the values within the tales, and the overarching theme of familial respect.

Within the frame tale, King Shahrayar discovers his wife's affair and executes her along with her lovers. Infidelity being a great sin in the Islamic faith; honor and respect are considered paramount in every Muslim household. Emasculated, he subsequently deems all women to be indecent. Seeking a public display of power, the king marries a virgin each day and orders her death the following morning after consummating the marriage, thereby thwarting further dishonor from females. Concocting a plan to show him the error of his ways, the *vizier's* daughter, Scheherazade, offers herself to King Shahrayar as his next wife. Scheherazade boldly states to her father: “Either I shall live or I shall be a ransom for the virgin daughters of the [Muslims] and the cause of their deliverance from [King Shahrayar's] hands and thine” (Burton 2008). Such a display of equality and trust between father and daughter was not commonplace, and stood in stark contrast to the treatment of women pre-Islam in the MENA region. While this interpretation ignores the King's brutality, Scheherazade was renowned as a bastion for Muslim females. The original sources reveal the brilliance and bravery of a woman that was honored by *hakawati* storytellers, becoming a profound aspect of the frame tale. Again within the frame tale, Scheherazade weds the King and narrates a series of stories expertly leading one into another, ending at the break of dawn on a cliffhanger. Human nature being partial to closure, the King's interest in Scheherazade's web of tales breaks his murderous run of brides. The listener concludes that women are intelligent and in control of their emotions whereas the King is a tyrannical barbarian. Only his execution of the first, unfaithful wife is deemed justified due to her adulterous behavior. As the days pass, the King's heart softens, and he falls in love with his bride. The frame tale, however, is only one of hundreds.

1542CE: Evangelizing South Asia

The impact of Christian missionaries in the MENA region is exemplary of the Occident imposing their beliefs upon historically subjugated citizenry. The impulse to convert other races to Christianity marks a dark period in history when the “other” was deemed inferior due to their beliefs. Prior to the first translations of *Alf Layla wa Layla* being widely available, the world stage sees Christianity infiltrating regions through missionaries. Perhaps as a result, even today

Christianity is widely associated with Europe despite its origin in the MENA region. European missionaries, including Saint Francis Xavier of Navarre, traveled by sea to evangelize. Saint Francis Xavier displayed particular interest in India, seemingly connecting with the Indian people of Goa whom he praised as being zealously receptive to the faith (Xavier 1543). A holistic analysis of Saint Francis Xavier's works, however, including his private letters, reveal his true attitude toward the Indian citizenry.

Although his admiration for Indian converts is apparent in his letter to the Society of Jesus at Rome, so is his vitriol toward those who continued to practice their faith. The Brahmins are described as a sclerosis, resistant to giving up their faith (Xavier 1543). Ironically he characterizes the Brahmins, the highest caste of Hindu society, of oppressing the lower classes through fear and control, just as the visiting evangelizing Europeans did, opining those who did not align with Christian beliefs as "wicked" and possessing "cunning and malice" (Xavier 1543). In essence, that which is not European and those who did not conform to European standards were condemned.

At the same time, however, it can be argued that Saint Francis Xavier, though he "othered" the Indians, nevertheless helped them to attain the same level of religious fervor he felt therefore demonstrating that the people of Goa were deserving of his faith. In this way, he armed them with what he believed to be the correct faith, thereby creating religious equals in some respects. His work was and remains largely admired by the European continent, and therefore, his opinions reverberate. Saint Francis Xavier's writings are exemplary of a wider thought process prevalent in that era.

1704-1717 CE: Antoine Galland's *Mille et Une Nuits*

The Colonial European era, spanning the fifteenth to twentieth centuries, witnessed European powers committing massacres in the name of revolution and European betterment (Hansen 2002). During this "Age of Discovery," European colonizers and curious civilians alike voyaged to African and Asian continents in search of knowledge, adventure, slaves, and riches, among other commodities. A polyglot, Antoine Galland was one of these men. Galland's knowledge of Arabic, French, Turkish, Latin, Greek, and Farsi garnered favor amongst the elite and earned him a position as a professor of Arabic in France.

Exposure to *Alf Layla wa Layla* came piecemeal over time, as Galland heard the tales through orators alongside native while living abroad in the Levant for years at a time. Galland first published seven volumes of incomplete tales, which were well-received (Bottigheimer 2014). The collection was named *Mille et Une Nuits*, or "The Book of a Thousand Nights and a Night."

Galland's *Mille et Une Nuits* paved the way for *The Arabian Nights* of today. As its popularity spread, the tales were retold in newspapers as weekly stories. They were published and republished in various languages and forms, translated and reinterpreted countless times over. Rather than translating the text faithfully, comparisons with original orations of the folklore make it clear that Galland "deleted, added, and altered drastically to produce not a translation,

but a French adaptation, or really a work of his own creation” (Mahdi, *The Arabian Nights* 1995). Whether or not Galland intentionally made these changes or simply sought to clarify or add context, the changes remain.

Regardless of how successful *Mille et Une Nuits* became, Galland appeared to have lost complete control. In fact, there is evidence he may have been at odds with his publisher, Claude Barbin. Two tales of Turkish origin were inserted at Barbin’s direction into a later edition of *Mille et Une Nuits*, seemingly to placate voracious readers. This addition is especially interesting due to the note Galland added to Volume 9: “The two tales with which volume eight finishes are not from the work *A Thousand and One Nights*: they have been inserted and printed without the translator’s knowledge. . . We will ensure to eliminate them in the second edition as tales foreign [to the collection]” (Larzul 2004). That publisher Claude Barbin made such an addition without consulting Galland indicates pressure to produce stories that engaged European readers rather than simply documenting the tales from an academic standpoint.

Through *Mille et Une Nuits*, Galland conflated the various cultures of Africa and Asia into a single entity. Additionally, Galland inserted the predominant western world view into his retelling of *Alf Layla wa Layla*, intending to appeal to an audience who considered the Orient to be “different” or “other.” Rather than translate, Galland chose to reinterpret the tales, creating stereotypes not present in the original orations.

1885CE: Sir Richard Burton’s *The Arabian Nights*

In 1885, nearly two hundred years and countless subsequent translations and republications later, Sir Richard Francis Burton’s translation took center stage as *The Arabian Nights*. Ultimately it would become the most popular translation, arguably to this day. *The Arabian Nights* elevated the tales to new heights of popularity. Like Galland, Burton was a polyglot, speaking multiple languages fluently; described as an “enemy of Victorian morality” (Young 2007; Knipp 1974). The cause for such a flagrant label was, amongst other things, his translation of the erotic *The Kama Sutra of Vatsyayana* in 1883 (Burton and Arbuthnot 1963). Burton went on to publish other controversial translations of poetry and erotica under the guise of a fictitious city, publisher, and secret society to evade obscenity laws of the time (Colligan 2002).

To understand how *The Arabian Nights*, considered by many to be a “classic” today, could once have been received as the equivalent of literary pornography, one must look briefly at Burton’s life and choices. Burton was expelled from Trinity College, Oxford for a disciplinary infraction and went on to join the army in the 18th regiment of the Bombay Native Infantry (Brodie 1984). During his eight years in India and what is now Pakistan, Burton mastered the local languages, infiltrating a local homosexual brothel in what became known as the Karachi Brothel Report (Brodie 1984). The explicit report detailed the illicit behaviors of troops, bringing Burton so much “slander and humiliation” it was recommended he be dismissed from service (Brodie 1984).

Sir Richard Burton went on to enter the Islamic holy cities of Mecca and Medina, posing as a Muslim, publishing a narrative of his journey: *El-Medinah and Mecca*, in 1855 to great acclaim (Brodie 1984). Burton did the same for the African City of Herer, publishing *First Footsteps in East Africa* in 1856 (Brodie 2023). Despite the controversial military report and publication of lewd translations, Sir Richard Burton was awarded knighthood by Queen Victoria in 1886 for his service to the crown.

Galland's Morality versus Burton's Sexuality

Sir Richard Burton's adventurous nature and curiosity combined with his grasp of languages made for an ideal background of scholarship to translate works such as *Alf Layla wa Layla* for a captive audience. This is not dissimilar to Antoine Galland. The primary difference here was ultimately their approach to translations. Galland was an original translator, translating from stories he heard from orators or read himself in Arabic. Galland's French translations were the first of such intended for a European audience. In doing so, his translations have been described as "frugal" as he chose to summarize the intent behind the words rather than give a word-for-word translation (Fudge 2016). Galland removed details he felt were unnecessary but added descriptions not present in the original tales, likely to underscore the unfamiliar culture and religion of the MENA for a European audience. Burton, translating nearly two hundred years later, took a functionally opposing stance. His annotations were colorful, intentionally sexually explicit, and attempt to explain the culture and nuances of tales that Europeans likely failed to grasp due to lack of exposure. Women became clever, sexual objects intended only for pleasure. Men and slaves were portrayed as savage and hedonistic, operating at the whim of their impulses. Burton's "zeal" in annotating *The Arabian Nights* drew much interest (Fudge 2016). However, his copious commentary was not limited to the annotations; Burton altered the simple language of the caravan tales, "pretending to translate the most complex and recherché of classical prose" (Fudge 2016). Burton's translations, predominant even today, "la[y] the groundwork of a deception" which "gives his version the attraction of the forbidden" (Knipp 1974).

While Burton dramatized and sexualized the tales, Galland, on the other hand, simplified them, which made them readily adaptable into popular children's stories. Lending "a touch of his own story-telling ability" to his translations of *Alf Layla wa Layla*, Galland modified the work to "adapt it to the European taste of the day" (Wazzan 1993). In his 1993 discourse analysis, Adnan Wazzan notes:

Galland's text is not so much a translation as a retelling for Western readership. He is not faithful to the basic plot and the spirit of the story, but in order to harmonize it with eighteenth century French taste he has added and removed material quite freely. The result of this process is a work which recognizably belongs to eighteenth century European literature; this without doubt led to its great popularity in the West and assisted in its assimilation into the mainstream of

European literary tradition....Galland very successfully transformed the *Nights* from a work of oral literature to one of written literature. However his treatment lacks the vitality of the original and transforms it into something more like a collection of fairy tales.

In the forward to *Mille et Une Nuits*, Galland states, "If those who will read these Tales show the faintest degree of disposition to learn from the examples of virtues and vices they will find, they will be able to draw an advantage that cannot be drawn from other tales" (Larzul 2004). In the famous, *Aladdin* for example, Galland "did his utmost to provide his readers with some instructive teachings, even though he did not quite succeed" (Larzul 2004). *Alf Layla wa Layla* was intended to entertain bedouins rather than teach; Galland labeled characters as a "good old man," a "barbarous father," or a "detestable old woman" to communicate how the reader ought perceive the character (Larzul 2004). In essence, Galland was unfaithful to the original tales and, despite being an academic, appealed to French tastes creating a work for mass consumption and entertainment rather than a scholarly, historical account to preserve posterity.

Racism, too, is present in Galland's translations. In the original orations, King Shahzaman's slaves are white. For Europeans to read that white people were slaves for a race they perceived as "less" or "other" would not do. Galland changed the slaves' race, making them black (Wazzan 1993). Burton, on the contrary, translated this aspect of the tales accurately. This change by Galland is an example of overt racism toward black people which painted an image in the mind of the Europeans who read the translated tales, reinforcing stereotypes of black people as inferior. Nevertheless, such a change was unlikely to be deemed substantial in the 1700s when *Mille et Une Nuits* was published.

In comparison to Galland's morality and racism, Burton's transgressions appear far more damaging. The tales popularized by Galland, such as "Aladdin," "Sindbad the Sailor," and "Ali Baba and the Forty Thieves," which became timeless favorites among children, were further modified by Burton. He introduced elements of sexual violence to these narratives, thereby intensifying the inherent sexual theme of a dishonored monarch who slaughters a his newlywed bride the morning after consummating the marriage (Colligan 2002). Burton was also explicit in his annotations and footnotes, which became a topic of much commentary and interest. He elaborated in great detail, giving lurid explanations so much so that the translation was deemed pornographic (Colligan 2002). A crude example that became infamous: "Debauched [Arab] women prefer Negros on account of the size of their parts" (Colligan 2002). Burton's notes in *The Arabian Nights* discuss his opinions, his travels in Africa, and are seemingly an attempt to justify his statements through personal observations and experiences.

The original tales undoubtedly contained sexuality but were not the intent of *Alf Layla wa Layla*. In Sir Richard Burton's translation sex is front and foremost, used by both genders for power and to oppress. Burton's background of academic disgrace and desire to involve himself in controversial areas, such as brothels and publication of erotic material, raises the question of whether he was a deviant. Although his knighthood seemingly indicates scholarship and prestige,

the explicit and crude nature of his commentary in *The Arabian Nights* has tarnished his professional image even today. Antoine Galland and Sir Richard Burton each translated *Alf Layla wa Layla* with different end products and varying reception. The social sensitivities and subjective biases translators and their European audiences had towards the Orient remains a salient factor as to *The Arabian Nights* misrepresentation in the European media.

Effect on Present Day Interpretations: Disney's *Aladdin*

Storytelling informs. To immerse oneself in a movie is to consume that subject matter, creating implicit and explicit familiarity regardless of whether one believes it to be fiction or a mere portrayal or adaptation. Contemporary film giant Disney's first movie containing MENA characters, *Aladdin* in 1992, was intended to have global appeal, bringing to life one of the hundreds of tales in *The Arabian Nights*. Disney's animated *Aladdin* won two Academy Awards and was their highest grossing film to date in 1992. Within mere seconds, the film became problematic. The movie began with the words, "*Oh, I come from a land, From a faraway place, Where the caravan camels roam, Where they cut off your ear If they don't like your face, It's Barbaric, but hey, it's home*" (Shaheen 1993). The lyrics are quickly set a tone. Disney changed the lyrics soon after their release, however it is notable that the lyrics were written, approved, recorded, and released to begin with. It appears that at no point prior to release did Disney realize that the animated film they were creating, which would be consumed worldwide by millions, was perpetuating racial stereotypes.

From Burton's *The Arabian Nights*, highly sexualized stereotypes of MENA women emerged. Disney took their own spin on this by portraying Jasmine, a princess with a Muslim name, in a scant top. Such clothing is not only atypical of the MENA, but unrealistic and suggestive of *harem* fantasy girls. Instead, many MENA women choose to wear modest clothing. However, with hundreds of little girls dressing up as Princess Jasmine for Halloween or make-believe, this image of the Arab woman persists.

Aladdin is portrayed in a fictional city in the MENA, a majority-Muslim region. This being so, the characters in the movie are also Muslim, and common phrases such as "mashallah" and "Praise Allah" are incorporated in the dialogue. Many of these sword-wielding, hot-headed characters choose violence first and facts later. In an infamous initial bazaar scene, Princess Jasmine naïvely picks up an apple without realizing she must pay for it. Muslim countries often enforce severe punishments such as chopping off a hand for stealing. Disney chose to include this in *Aladdin*, as the shopkeeper insists Jasmine must be punished and a sword is raised to take her hand. While the punishment is technically correct, it would not occur in such an immediate fashion, without witnesses or first inquiring into the circumstances. Similarly, Aladdin is chased about town by angry and seemingly incompetent guards who intend not to question him, but to immediately kill him for his role in helping Jasmine evade punishment. Although audiences realize the movie is fiction, it is difficult to walk away from this animated portrayal of what has become a children's classic without thinking of Muslims and Arabs as excessively violent.

Galland's *Mille et Une Nuits*, Burton's *The Arabian Nights*, and Disney's *Aladdin* each contribute to the tropes of orientalism. The translations and adaptations perpetuating stereotypes of exotic, angry, and hypersexual people. That magic carpets and genies are representative of the MENA and Islam is not far removed from believing that fairies and witches represent the West.

Conclusion

Just as European children's classics carry with them cautionary tales and lessons, great pains were taken to replace MENA values with Western morals as well. Rather than a direct translation true to its origin, the tales were re-written and reimagined through an ethnocentric lens. Colonialist European translations of *Alf Layla wa Layla* were therefore inaccurate and changed from the original text to appeal to the European demographic. The French and later English translations of *Alf Layla wa Layla* had lasting impact on the perceptions of both Arabs and Muslims. Orientalist perceptions did not disappear post-colonialism (Said 1979). From a historical perspective, *Mille et Une Nuits* did serve to integrate the MENA region with Europe in the sense that it made popular an unfamiliar culture and faith. These first exposures to a foreign culture and faith through a literary device intended to entertain rather than inform undoubtedly created injudicious perceptions, laying the foundations for present-day Islamophobia (Farhi 2008).

The Impact of Political Frameworks on Lifestyle Apps By Hillary Zheng

Abstract

Over the past three decades, smartphones have become essential in modern society, facilitating communication and entertainment, especially during transformative events like the Covid-19 pandemic. Yet, media usage varies widely due to fundamental differences in government styles, specifically between China and the United States. China's centralized, authoritarian government imposes strict control over internet content, resulting in tightly regulated platforms such as WeChat and Douyin. Conversely, the U.S. democratic framework prioritizes freedom of speech and minimal intervention, allowing platforms like TikTok and Instagram to operate with greater autonomy. These divergent regulatory environments shape user behavior and app development, with China emphasizing control and stability and the U.S. fostering innovation and diversity. In light of these contemporary trends, this study aims to be an initial start to a broader literature analysis and a survey of over a hundred individuals to elucidate the impact of contrasting governmental frameworks on digital app usage. The findings reveal that Americans are predominantly drawn to these apps for entertainment, while the Chinese primarily utilize them for communication. Consequently, these results suggest a significant disparity in usage duration among the sampled population, with Americans averaging an impressive three hours more than the Chinese, though this may not represent the entire population. These results imply that the democratic and relatively permissive governmental oversight of media in the United States often leads to increased diversion among its users. This further underscores the challenges faced by the American government in regulating media consumption, given the constitutional rights that protect freedom of expression. Conversely, the more stringent media control in China appears to foster a more utilitarian use of digital applications, focused on communication rather than entertainment.

Introduction

Currently, the significance of lifestyle apps transcends mere convenience, particularly highlighted during transformative events such as the Covid-19 pandemic. These apps are now deeply intertwined with our routines and considered essential for various tasks. Through an examination of case studies focusing on Instagram and WeChat, we can comprehend the profound impacts of lifestyle apps on users. These platforms have fundamentally altered how individuals interact online, presenting both opportunities and challenges for users worldwide. Given mental health implications, societal consequences, and efficiency concerns, it is evident that while valuable, these platforms necessitate regulation to ensure responsible usage.

For example, the Chinese government tightly controls the development and usage of lifestyle apps, particularly those with social networking capabilities like TikTok and WeChat. The government imposes strict regulations on content, data privacy, and user interactions to align with its political agenda and maintain social stability ("China"). Apps must adhere to censorship guidelines, and foreign platforms face additional scrutiny, often resulting in bans or restrictions.

In contrast, the United States generally adopts a more hands-off approach to regulating lifestyle apps, prioritizing freedom of speech and innovation (Scalon). While there are regulations governing data privacy and consumer protection, there is less government intervention in content moderation and platform governance. Companies like Facebook, Instagram, and Twitter have more autonomy in setting their policies and enforcing community standards.

Given these differences, China and the United States approach the regulation and development of lifestyle apps differently. China's strict regulatory environment has resulted in greater control over content and user behavior, potentially limiting innovation and stifling freedom of expression (“China”). Nonetheless, it also fosters a sense of security and stability for users. On the other hand, the United States' more liberal approach has encouraged innovation and competition among app developers, leading to a diverse range of offerings and user experiences. However, it has also raised concerns about data privacy, misinformation, and the spread of harmful content.

Diverging Paths Within Politics, Society, and Technology

China and America are fundamentally different in their political, social, and cultural roots, stemming from their distinct forms of government, leadership structures, and approaches to media and internet regulation. China operates under a Leninist "party-state" led by the Communist Party of China (CPC), in which centralized control over governance, media, and society is paramount (Lawrence). In contrast, America is a federal democratic republic, characterized by the division of power between the national government and individual states (Clyburn), as well as a system of checks and balances among the executive, legislative, and judicial branches. These foundational differences shape various aspects of life in each country, including political participation, freedom of expression, and individual rights. While China prioritizes collective goals and party loyalty (“China”), America emphasizes individual liberties, democratic principles, and pluralism (Clyburn). These fundamental disparities underscore the divergent trajectories of development and governance between the two nations, influencing their respective approaches to technology, innovation, and societal norms.

During the COVID-19 pandemic, there was a pronounced shift towards app usage, with 87% of users expressing a preference for applications over traditional websites (Torok). This transition coincided with significant changes to spontaneous social interactions due to the shift to digital communication, even after the pandemic had subsided. Specifically, social evenings with relatives dropped by 19% from 2018 to 2021. Interactions with friends saw a larger decline of 26%, while social gatherings fell by 32% over the same period (Lee et al.). Consequently, there has been a notable surge in reliance on technology for social engagement, prompting many organizations to adopt either a hybrid or fully remote operational model. Projections by *Forbes* suggest that by 2025, approximately 32.6 million Americans will be remote employees, constituting 22% of the workforce, a substantial increase from the 12% recorded in 2023 (Haan).

The pervasive allure of virtual media has captivated a staggering 4.8 billion individuals worldwide, representing nearly 59.9% of the global population and approximately 93% of

internet users (Jones). This engagement is underscored by an estimated annual increase of 3.2%, consolidating virtual platforms as an integral aspect of daily life (Jones). Collectively, individuals devote an astounding 11.5 billion hours per day to social media platforms, equivalent to approximately 13128 centuries of cumulative engagement (Jones). Such monumental figures underscore the transformative influence of virtual media, potentially heralding paradigm shifts in societal dynamics.

Furthermore, the burgeoning popularity of fast-paced multimedia content has permeated even governmental operations. As elucidated by "Liberal Democracy and the Social Acceleration of Time," the rapid tempo of contemporary society has precipitated a systemic imbalance within democratic frameworks, favoring executive branches adept at swift responses, while legislative and judicial counterparts grapple with adaptation.

Social media has dramatically accelerated the pace of modern life by fostering instant access to information, increasing global connectivity, and creating a constant stream of engagement that compresses decision-making timelines. This rapid flow of information and heightened connectivity intensify societal pressures, leading to a faster-paced lifestyle where individuals and institutions must react swiftly. In the realm of government, this accelerated pace has influenced the balance of power among the branches. For instance, President Joe Biden's first 100 days saw over 60 executive actions, with 24 directly reversing Trump's policies, reflecting the executive branch's ability to swiftly implement changes (Hickey et al.). This quick response capability, driven by social media's immediacy and public pressure, often bypasses the slower legislative process and judicial review. The legislative and judicial branches, bound by more deliberate procedures, struggle to keep up with the rapid pace of executive actions, leading to an imbalance where the executive branch can act more decisively and independently. Social media's amplification of public and media pressure further exacerbates this imbalance, highlighting the executive branch's increased power as it navigates the fast-moving landscape created by digital communication.

Consequently, concerns regarding the efficacy of liberal democracy have emerged, necessitating recalibration to synchronize with the cadence of modernity. The rise of social media raises questions about whether governments need to adapt to its widespread influence, highlighting the strong impact of mass media on society and governance.

Additionally, the evolving landscape of privacy regulations and terms of service has engendered notable shifts. Noteworthy applications such as Safari and Instagram have intensified data collection practices to optimize marketing strategies, leveraging personal information to tailor content and advertising. A study conducted by USENIX has corroborated reports of pervasive surveillance, as commonplace applications eavesdrop on conversations to refine audience targeting (Saltaformaggio et. al). Consequently, personalized advertising and content dissemination became ubiquitous, reshaping consumer experiences and industry landscapes. Amidst these transformations, the overarching question emerges: Can society effectively harness technological evolution for collective advancement?

Introduction to Wechat and Tiktok Pre-Pandemic

Introduced in September 2016, TikTok was originally launched as Musical.ly in 2014, rebranding to its current name in 2018 (Bertel). The app initially focused on short-form music videos, where users could create and share lip-sync performances and dance clips. This early content primarily featured playful interactions with popular songs, but TikTok's influence quickly expanded as it evolved.

After rebranding as TikTok, the app diversified its content offerings and grew its user base exponentially. One of the key moments in its evolution was the viral success of the "Renegade" dance challenge, which propelled creators like Charli D'Amelio and Addison Rae into the spotlight. This phenomenon illustrated TikTok's power in turning users into celebrities and creating viral trends.

The app has also become a significant platform for music promotion. Songs featured in TikTok videos can gain immense popularity, leading to recognition for previously unknown artists such as Megan Thee Stallion and Doja Cat. The platform's integration of music has become a strategic tool for artists and record labels, with many aiming to produce tracks that align with current TikTok trends to achieve chart success.

In addition to entertainment, TikTok has established itself as a powerful medium for social and political activism. The app has been used to amplify movements such as Black Lives Matter and to organize political protests, including the notable instance where users reserved seats for a Donald Trump rally as a form of protest. TikTok has thus become a space for younger generations to express political views and engage in social discourse.

Today, TikTok boasts over 2.6 billion downloads globally, making it one of the most popular social media platforms. Its wide range of content, from comedy skits and makeup tutorials to viral challenges and activism, contributes to its broad appeal and massive user engagement.

WeChat, on the other hand, was launched three years earlier in 2011 by Chinese company Tencent, initially focused on messaging, offering text and voice messaging and voice and video calls (Volle). However, amid the transformative impacts of the pandemic, WeChat evolved into a multifaceted platform.

Since its launch in 2011 as Weixin, WeChat has evolved significantly. Initially, the app focused on basic text and voice messaging, but it quickly expanded its features. In 2012, after reaching 100 million users, Weixin was rebranded as WeChat to appeal to a global audience. This rebranding marked the beginning of a period of rapid feature expansion.

By 2013, WeChat had introduced voice and video calls and the "Moments" feature, which allowed users to share photos and status updates with their network. In 2014, the launch of "Public Accounts" enabled businesses and organizations to engage with users, while the introduction of Mini Programs allowed for a range of services within the app itself. By 2015, WeChat Pay was introduced, transforming the app into a mobile payment platform that facilitated transactions and money transfers.

The years from 2016 to 2019 saw further diversification. WeChat enhanced its Mini Programs to include e-commerce and booking services and launched WeChat Work for business communication. The addition of in-app games and advancements in artificial intelligence and augmented reality enriched the user experience. By 2019, WeChat had developed a comprehensive digital ecosystem with an expanded range of services and partnerships.

In recent years, WeChat has continued to innovate and expand. Its social and communication tools now support rich media sharing, enhanced voice and video calls, and advanced Mini Programs offering various services from shopping to government functions. WeChat Pay has grown to include financial management features and integration with banking services. Despite its global reach, WeChat faces scrutiny over privacy concerns and its role in government surveillance, issues that have impacted its international expansion efforts.

Due to these advancements, both apps witnessed explosive increases in usership, becoming integral to daily life, particularly due to the isolated nature of the pandemic.

Fig 1. This photograph portrays the most popular TikTok group known as the hype house dominating the platform during the early stages of the pandemic (Shou).

During the Pandemic

Evidently, significant changes occurred during the Covid-19 pandemic. Lockdown measures in the United States prompted many organizations and institutions to undergo substantial transformations in their operations. This abrupt adjustment to a new way of life granted individuals more leisure time, leading to a notable surge in online entertainment. During the Covid-19 pandemic, consumer behavior shifted dramatically towards online media streaming, a trend that has continued to reshape the content consumption landscape. By June 2020, 48% of US online adults had subscribed to at least one streaming service, reflecting a significant surge in demand for digital content.

The pandemic accelerated changes in media consumption patterns. Prior to the pandemic, offline TV/video consumption averaged 13 hours per week in 2010, but this had declined to 8.6 hours by 2020. Conversely, online TV/video consumption saw a remarkable increase from 1.7 hours per week in 2010 to 7 hours per week by 2020. The pandemic further intensified this shift, with 46% of consumers reporting that they spent the same amount of time on their personal devices as they did during the pandemic restrictions, and 39% indicating they spent even more time on their gadgets (Bushong).

As of 15 months into the pandemic, 28% of US online adults reported feeling fatigued from excessive TV and film consumption, and 21% planned to reduce their TV/video viewing as restrictions eased. Despite this, 41% of consumers enjoy watching TV/video even more now than before the pandemic, and 42% continue to use TV/video as a way to distract themselves from real-world stressors. This suggests a lasting impact of increased media consumption, even as other activities become more accessible.

Among these statistics, TikTok distinguished itself among the plethora of emerging social platforms, accumulating over 656 million users in 2021, as reported by Forbes (Koetsier). TikTok's appeal lies in its accessibility and authenticity. Unlike other social media platforms dominated by celebrities, TikTok remained approachable, with its main feeds focusing on everyday users. Psychologists, such as Prerna Kohli from Vice India, note that TikTok provided a safe space for users to express themselves authentically, without the pressure to maintain a social facade. This sense of authenticity offered solace to individuals grappling with feelings of self-worth and identity during uncertain times ("Rise").

This period saw lifestyle apps expanding to cover a wide range of categories including fitness, beauty, health, dating, music, food, travel, and communication. WeChat, in particular, evolved beyond being just a messaging platform to better cater to its users. Similar to TikTok, there was a sudden surge of 50 million users in the midst of the pandemic (Zhu and Chhachhar). What propelled WeChat's growth during this time was its multifaceted architecture, combining elements of Facebook's sociability, WhatsApp's connectivity, and an diverse array of entertainment and financial features, as outlined in a study by Tsinghua University (Zhu and Chhachhar).

After the Pandemic

Today, TikTok has evolved far beyond its origins as a simple video platform. With over 1.7 billion users in 2023, it has occasionally surpassed industry giants like Google ("Tiktok"). Statista data reveals that users spend an average of more than 1.5 hours daily on the platform, with nearly half favoring TikTok over Google for their search needs ("Average"). TikTok's influence now extends to online shopping, where users can promote products through videos and effectively sway purchasing decisions. Its appeal lies in the sharing of relatable content through succinct, sub-minute videos, resonating particularly with Generation Z, who quickly digest narratives and concepts within seconds.

However, alongside its meteoric rise, concerns have arisen regarding its impact on users' mental well-being. Research from the National Library of Medicine suggests a correlation between TikTok's rapid content consumption and memory loss, accompanied by heightened levels of depression, anxiety, and stress (Sha and Dong). The organization's findings indicate a positive correlation between depression, anxiety, and what experts term "Internet use disorder" or "smartphone use disorder." (Sha and Dong).

Despite these drawbacks, TikTok's addictive allure persists, fueled by its relentless delivery of relatable content. The instantaneous rush of dopamine upon viewing a video creates a potent emotional response, fostering a fear of missing out (FOMO) among users if they refrain from continuous scrolling. For many adolescents and young adults, TikTok serves as an escape, albeit one fraught with potential long-term consequences.

Moreover, TikTok's influence extends beyond mere entertainment, shaping perceptions and behaviors, particularly concerning the consumption of news. The platform's distorted media landscape contributes to a diminished patience among users, rendering them more susceptible to misinformation. A study conducted by Nic Newman, in collaboration with the Reuters Institute and the University of Oxford, highlights the susceptibility of young minds to manipulation, leading to an over-reliance on influential figures within the TikTok sphere.

Paralleling TikTok, WeChat has grown into an expansive platform, boasting over 1.2 billion active users and firmly establishing itself as the premier communication app in China (Fulmer). Research conducted by students at Tsinghua University reveals that many users dedicate upwards of three hours per day to the app. This remarkable adoption underscores WeChat's evolution into a multifaceted hub, seamlessly integrating social networking, online shopping, financial transactions, and entertainment. Such versatility underscores WeChat's profound impact on digital innovation, cementing its position as a cornerstone of the digital landscape in China.

By the end of 2023, WeChat experienced an astronomical ascent, witnessing a staggering 2686% surge from its nascent stage of million users in 2012 (Iqbal). This quantum leap underscores its metamorphosis from a fledgling endeavor to an indispensable facet of the digital milieu. Its expansive repertoire of features and seamless integration into the fabric of daily existence sets WeChat leagues apart from its contemporaries, such as QQ. While QQ remains tethered to the realm of instant messaging, WeChat transcends these boundaries, offering a panoply of functionalities. From hailing a taxi to purchasing groceries, executing financial transactions, and sharing life's nuances on its social media platform, WeChat has emerged as the quintessential Swiss Army knife of digital utilities.

The yearning for convenience and efficiency has propelled WeChat into the stratosphere of payment preferences, with an estimated 50.6% of China's populace opting for its seamless transactional interface by the conclusion of 2023 (Elad). A revelatory report divulges that a staggering 1.1 billion denizens engage in daily online transactions through WeChat, underscoring its indispensability in modern commerce. The user-friendly interface and unparalleled

convenience further entrench WeChat's hegemony, cultivating an ecosystem where utility converges with user experience (Verot).

WeChat's formidable impact on information dissemination has emerged as a hallmark of its ascendancy. Empowering users to share their narratives and perspectives through the "Moments" feature, akin to Facebook's timeline, WeChat has become the conduit for the dissemination of news, opinions, and communal discourse. The year 2023 witnessed a monumental milestone, with 120 million users publishing updates daily, underscoring WeChat's centrality in the information dissemination paradigm (Verot).

But, beneath the veneer of convenience lies a nuanced tapestry of societal implications. WeChat's magnetic allure engenders a labyrinth of emotions, sparking a fear of missing out and fostering deleterious psychological ramifications, akin to the pitfalls of TikTok. Moreover, the platform's widespread use for sharing information leads to a dangerous spread of misinformation and distorted realities, threatening the truth in public discussions.

Despite these caveats, WeChat stands as an immutable cornerstone in the lives of the Chinese populace, an essential partner in the daily pursuit of efficiency and connection.

In light of these compelling statistics, it is evident that government intervention is essential to safeguard the well-being of the youth. A proposed solution entails mandating a weekly shutdown of all social media platforms, providing individuals worldwide with a day-long respite from digital distractions. This initiative aims to redirect attention towards local communities and familial bonds, encouraging individuals to prioritize tangible interactions over virtual engagements.

Survey Insights

In a survey conducted for this paper, over 135 individuals were queried about their interest in digital applications. The respondents represented a diverse demographic, ranging from students to adults in government-affiliated positions such as police officers and firefighters. On average, Americans dedicate approximately 4.5 hours daily to social media platforms like TikTok and Instagram as represented in Figure 2. Consequently, nearly 74% of digital app users engage with these applications primarily for entertainment purposes.

Interestingly, 91.6% of respondents demonstrated at least a mild interest in understanding the underlying mechanisms of app algorithms. Unsurprisingly, only about 50.6% of the surveyed population expressed confidence in the reliability of the information they consume on these platforms.

In contrast, the average screen time in China is approximately 1.5 hours per day, with a predominant use of WeChat for communication. Notably, 83% of the Chinese respondents expressed no interest in understanding how algorithms function. Additionally, nearly 50% of them indicated a lack of interest in the media suggested to them. Nevertheless, around 68% of the Chinese respondents believe that the information they consume is reliable and safe.

How many hours do you typically spend on these apps daily?

Fig 2: This graph illustrates the upward trend in average screen time for Americans, with some admitting to using it for more than eight hours a day.

Case Study Analysis

Currently, The United States faces unique challenges in managing media due to its foundation of the First Amendment, which guarantees freedom of speech, press, and expression. This constitutional right provides broad protections for individuals and media organizations, making it difficult for the government to impose restrictions without running afoul of the Constitution. Attempts to regulate or ban platforms like TikTok, as seen in recent legislation, must navigate complex legal terrain and may face scrutiny for potentially violating freedom of the press rights and freedom of speech rights.

More specifically, the current TikTok “ban,” or rather TikTok “sell,” challenges the American Constitution primarily on First Amendment grounds, which protect freedom of speech and expression. The ban could restrict millions of users' ability to express themselves, as well as hinder creators and businesses relying on the platform for communication and commerce. It raises concerns about government censorship, setting a precedent for restricting access to digital platforms and potentially suppressing political speech. Legal challenges include arguments of unconstitutional taking under the First Amendment and due process violations due to the ban's potential vagueness and overbreadth.

The First Amendment guarantees Americans the right to freely access and disseminate information. Critics argue that a ban on TikTok, a popular platform for sharing and consuming content, could infringe upon these rights (Harwell). Historically, the Supreme Court has upheld the principle that the government cannot restrict access to ideas and information without a compelling reason. Thus, TikTok's defenders contend that a ban would unjustifiably limit Americans' ability to engage with diverse content and ideas.

Another significant issue is whether the ban constitutes a content-based restriction rather than a content-neutral one. The new law seeks to force TikTok's sale or impose a ban due to concerns over its Chinese ownership, not because of the specific content it hosts. However, if the law is perceived as targeting TikTok due to the nature of its content or its influence, it could be challenged as a content-based regulation, which faces stricter scrutiny under the First Amendment.

The prohibition against "bills of attainder" also plays a crucial role in the legal debate. Bills of attainder are legislative acts that punish specific individuals or groups without a trial. Critics argue that the new law, by explicitly targeting TikTok and ByteDance, may function as a bill of attainder. This concern is bolstered by the fact that an earlier version of the bill was titled "TIKTOK.XML," which explicitly named TikTok. Such specifics could be leveraged in court to argue that the law is punitive rather than regulatory.

Under First Amendment jurisprudence, the government must use the least restrictive means to achieve its objectives when imposing restrictions on speech. Defenders of TikTok argue that the law is not the least restrictive means available, pointing to alternative solutions like enhancing data privacy regulations or implementing measures such as Project Texas, which proposed significant changes to address data security concerns. The failure to consider these alternatives could be used to argue that the law is overly restrictive.

Additionally, the balance between national security interests and constitutional rights is a critical aspect of the debate. While courts generally defer to national security concerns, they require that any action taken does not excessively infringe upon constitutional freedoms. The challenge is to demonstrate a clear and present danger that justifies the restrictions imposed. So far, the government has not provided compelling evidence that TikTok has been used by the Chinese government for espionage or propaganda. This lack of evidence could be a significant factor in any legal challenge to the ban.

Finally, the selective targeting of TikTok, technical enforcement challenges, and broader implications for international relations, market impact, and digital innovation make the legislation contentious and difficult to enforce without significant legal and practical hurdles.

Unlike in countries with more centralized control over media, where government censorship can be more easily enforced, the United States must balance concerns over national security, privacy, and societal impact with the principles of free speech and press freedom. This tension underscores the ongoing debate in the U.S. over how to effectively regulate media platforms while upholding constitutional liberties, highlighting the complexities inherent in managing media in a democratic society built on principles of individual rights and freedoms.

America's style of government, characterized by its separation of powers and system of checks and balances, presents inherent challenges in regulating rapidly evolving technologies such as artificial intelligence (A.I.). The legislative branch, responsible for crafting laws and regulations, often struggles to keep pace with the swift advancements in technology due to bureaucratic processes, partisan gridlock, and a lack of technical expertise among lawmakers. As

a result, proposed bills aimed at addressing the potential risks and benefits of A.I. may face delays or stall altogether in Congress, leaving significant regulatory gaps.

Moreover, the executive branch's role in implementing and enforcing regulations is subject to changes in administration, policy priorities, and resource allocation within regulatory agencies. This inconsistency often impedes on the development of cohesive and comprehensive regulatory frameworks for emerging technologies. Additionally, the judiciary's interpretation of existing laws and regulations in the context of A.I. presents its own challenges, as courts may struggle to apply outdated legal frameworks to novel technological applications. As a result, legal precedents may take time to establish, leading to uncertainty and ambiguity in the regulatory landscape surrounding A.I and technological advances through apps.

Conversely, China's approach to censorship empowers the government to maintain extensive surveillance over its citizens' online activities while simultaneously controlling the flow of information in the media landscape. Through a combination of technological infrastructure, regulatory requirements, and legal frameworks, China's censorship apparatus creates a highly effective system for monitoring and regulating both online content and offline media.

Technologically, the "Great Firewall" enables the government to intercept and filter internet traffic, blocking access to politically sensitive content in real-time (Mackinnon). This infrastructure, coupled with requirements for internet service providers and content providers to implement censorship measures, ensures that only approved information reaches Chinese users. Additionally, surveillance and data collection practices extend to email and web chat services, allowing authorities to monitor online communications and track individuals' activities.

Regulatory compliance is enforced through licensing requirements for internet content providers, who are held responsible for all content hosted on their platforms. This incentivizes providers to actively monitor and censor content to avoid penalties, creating a self-regulating environment. Legal frameworks, such as the Provisions on the Administration of Internet News Information Services, impose strict controls on news websites and limit reporting to government-approved sources, further enabling government control over media content.

Conclusion

The evolving landscape of lifestyle apps, particularly amidst the Covid-19 pandemic, has underscored their profound impact on user well-being, societal dynamics, and media consumption behaviors. The pervasive influence of these apps is clearly elucidated through case studies on platforms like TikTok and WeCha, highlighting both their benefits and challenges. However, the regulatory approaches to these apps differ significantly between the United States and China, reflecting broader differences in governance, media censorship, and societal norms.

The United States, with its emphasis on individual liberties and democratic principles, faces inherent challenges in regulating rapidly evolving technologies like artificial intelligence. The separation of powers and complex legislative processes often hinder the development of cohesive regulatory frameworks, leaving significant gaps in oversight. In contrast, China's

centralized control over governance and media enables extensive surveillance and censorship, fostering a highly regulated environment that prioritizes government control over information flow.

Despite these differences, both countries must grapple with the societal implications of lifestyle apps and emerging technologies. Balancing innovation with the protection of user rights and societal well-being remains a complex challenge. Moving forward, international collaboration and dialogue will be essential to address these issues effectively and ensure that lifestyle apps contribute positively to the lives of users while minimizing potential risks. By bridging regulatory approaches and sharing best practices, policymakers can navigate the complexities of governing technology in an increasingly interconnected world, ultimately fostering a safer and more inclusive digital environment for all.

The Economic and Social Impact of Government Education Expenditure: Empirical Evidence from OECD Countries

By Rinta Seto

Abstract

This study aims to investigate the relationship between government education expenditure and various economic variables, such as unemployment, income, and the happiness index, across OECD countries. The paper used scatterplot graphics and cross-sectional regression analysis. After controlling the effect of many indicators, including GDP per growth, interest rate, inflation, and trade, the findings indicate a persistent negative association between government expenditure on education and unemployment, implying that increased investment in education may lead to a decrease in unemployment rates. Moreover, a positive association exists between educational expenditure and income, suggesting that investment in education may result in increased income. The results suggest that educational investment significantly influences happiness levels, as evidenced by the strong correlation between the happiness index and government education spending. The study provides valuable insights for policymakers aiming to utilize education spending as a tool to improve economic and social well-being.

Keywords: Education expenditure; unemployment rate; income; happiness index

Introduction

People all over the world, especially in developing countries, are always interested in the link between government spending on education and socioeconomic indicators. Policymakers all over the world need to know how government education spending impacts the key socioeconomic indicators, unemployment, income, and well-being. Current economic issues, including fluctuating unemployment rates, income inequality, and the pursuit of sustainable development, underscore the importance of this topic. This paper aims to investigate whether government spending on education has a statistically significant effect on unemployment, income, and the happiness index by looking at cross-sectional data from OECD countries.

For international readers, these topics offer insights into how government policy decisions can have wide-reaching impacts. We can use the results to guide not only national economic policies but also global development efforts aimed at raising living standards and reducing inequality.

Looking at how much the government spends on education in different areas gives us a chance to compare how various policies can affect economic and social factors differently. Countries can use this paper as a guide to enhance their policies, boost economic growth, reduce unemployment, and improve the overall well-being of their citizens.

Moreover, this paper enriches the existing literature on education economics by presenting evidence for understanding how government investment in education influences both economic outcomes and social well-being.

Literature Review

The relationship between government expenditure (GovExp) and unemployment (UnEmp) has been extensively analysed in several countries, particularly for emerging economies.

For example, the research undertaken in Nigeria produced controversial results. Nwamuo (2022) established that capital expenditure significantly reduces unemployment in both the short and long term. Similarly, Binuomoyo (2020) found that public expenditure on education in Nigeria positively correlates with unemployment, challenging the presumption that more investment in education will reduce unemployment.

In the long run, Abouelfarag and Qutb (2020) indicated that there is a significant positive correlation between government spending and the unemployment rate, challenging the Keynesian theory that says government expenditure makes the economy grow and creates jobs. Selase (2019) and Fosu (2019) analysed a broader dataset of African countries and found that the effect of government expenditure varies depending on the type of expenditure. Investment in infrastructure and education reduces unemployment, while expenditures on defence and health typically increase it. This indicates that the characteristic of government spending plays a significant role in the unemployment rate (Onuoha and Agbede, 2019).

Nepram et al. (2021) examined the effects of developmental versus non-developmental expenditure in India. They emphasized that non-development expenditure increases unemployment more than development expenditure does. This finding was consistent across states. Indicating that education expenditure alone does not guarantee lower unemployment. Saraireh (2020) studied the case of Jordan, emphasizing the long-term relationship between government expenditure and unemployment, notably 1 percentage increase in government spending resulted in a 0.43 percentage reduction in unemployment.

Diverse econometric techniques were employed in the investigations, including ARDL and ECM (e.g., Nwamuo, 2022; Saraireh, 2020); OLS regression (e.g., Binumoyo, 2020); GMM (e.g., Selase, 2019); and VECM (e.g., Abouelfarag and Qutb, 2020).

The findings suggest that certain types of government spending can reduce unemployment, while others may not have the same impact. The effectiveness of government expenditure on the economy and policy depends on how well the programs are implemented. The literature indicates varied outcomes on the influence of government spending on unemployment across diverse geographies and categories of expenditure. It suggests that not all governmental spending helps reduce unemployment.

A literature review on the relationship between government education expenditure and income reveals a variety of findings across different countries and periods. These studies employed a range of econometric methods to analyse how education expenditure influences income distribution with a focus on microeconomic indicators and specific control variables. Kevin Sylwester (2000, 2002) examines the influence of educational spending on global economic inequality. The findings indicated that increased educational expenditure correlates with economic inequality, particularly in OECD nations.

Artige and Cavenaile (2017) examine the U-shaped correlation between governmental educational expenditure and income inequality in eight major economies. They argued that increasing spending can enhance human capital growth and thus reduce income inequality at first. However, higher teacher wages funded through government education expenditure can paradoxically increase inequality if the wage premium grows excessively.

Regional and country-specific studies insights into how education expenditure affects income distribution. Köse and Güven (2007) analyzed government education expenditures in Turkey from 1975 to 2001. Their findings suggest that increased spending by the Ministry of Education helps reduce economic inequality. In Indonesia, Alamanda (2020) examines the relationship between government expenditure on infrastructure, social aid, subsidies, and grants with economic disparity and poverty.

Research in Nigeria Ahamba et al. (20202) explores the effect of government education expenditure on per capita income, using dynamic autoregressive distributed lag (ARDL) modelling over the periods from 1990 to 2018. The study reveals that while the secondary and high school enrollment ratio positively impacts GDP per capita, primary school enrollment has a negative effect in the short term.

Karim (2020) examines public education expenditure in Bangladesh and its impact on income distribution. This study concludes that investment in primary and secondary education mitigates economic disparity.

Literature indicates that government education expenditure can enhance income distribution, however, the extent and characteristics of income differ by country, location, and expenditure type. Research indicates that government expenditure on primary and secondary education is more effective at reducing income inequality than on higher education.

To solve this complex issue, a variety of econometric techniques are used including OLS regression, panel data analysis, and dynamic ARDL models. Research demonstrates that additional factors, including political stability and economic growth, significantly influence the relationship between education expenditure and income distribution.

The literature on the happiness index demonstrates that different socioeconomic factors affect each other in many ways. Income, social support, and life expectancy are critical determinants of the happiness index across over 115 countries, as emphasized in the World Happiness Report (2023) by John F. Helliwell, Richard Layard, and Jeffrey D. Sachs. Coyne and Hall (2017) established a positive link between the happiness score and government expenditure across 79 nations. Helliwell and Putnam (2004) illustrate that trust and strong social networks substantially enhance well-being. Cheung and Chan (2009) assert that contentment scores are positively correlated with higher educational attainment across 35 nations.

Hanushek et al. (2015) argue that while income impacts happiness, social trust plays a more critical role, especially in developing countries.

As a whole, these studies emphasize that the happiness index is not solely determined by economic wealth, but is also significantly influenced by social factors. Education attainment, government education expenditure.

This body of research provides valuable insights for policymakers seeking to use education expenditure as a tool for reducing unemployment and increasing income and happiness.

Results and Discussion

Statistical Analysis

Appendix 1 presents various indicators sourced from the World Bank World Development Indicator and Our World In Dataset. The variables include Unemployment as a percentage of the total labour force (UnEmp), Income (Income), Happiness index (HappinessIndex), Government expenditure on education as a percentage of GDP (GovExp), GDP per capita growth as an annual % (GDPperGrowth), Real interest rate as % (InterestRate), Inflation as a consumer price index (Inf), and Trade as % of GDP (Trade).

Table 1. Descriptive Statistics for the variables used.

Variable	Obs	Mean	Std. Dev.	Min	Max
UnEmp	5576	7.877	5.706	.039	57
Income	9549	6183.558	10463.326	-115.775	82579.178
HappinessIndex	754	78.29	15.015	29.407	99
GovExp	6059	4.287	1.806	0	44.334
GDPperGrowth	13813	1.949	6.105	-64.426	150.431
InterestRate	4607	5.359	15.501	-97.693	628.32
Inf	10998	19.867	288.589	-17.64	23773.132
Trade	10978	73.1	50.98	.021	863.195

Table 1 provides descriptive statistics for various variables used in the analysis.

UnEmp has 5576 observations with a mean of 7.877 and a standard deviation of 5.706, ranging from a minimum of 0.039 to a maximum of 57.

Income has 9549 observations with a mean of 6183.558 and a standard deviation of 10463.326, ranging from a minimum of -115.775 to a maximum of 82579.178.

The HappinessIndex has 754 observations, with a mean of 78.29 and a standard deviation of 15.015, spanning a minimum value of 29.407 and a high value of 99.

GovExp comprises 6059 observations, with a mean of 4.287 and a standard deviation of 1.806, spanning a low of 0 and a maximum of 44.334.

GDPperGrowth has 13813 observations with a mean of 1.949 and a standard deviation of 6.105, ranging from a minimum of -64.426 to a maximum of 150.431.

InterestRate has 4607 observations with a mean of 5.359 and a standard deviation of 15.501, ranging from a minimum of -97.693 to a maximum of 628.3.

Inf has 10998 observations with a mean of 19.867 and a standard deviation of 288.589, ranging from a minimum of -17.64 to a maximum of 23773.132

Trade has 10978 observations with a mean of 73.1 and a standard deviation of 50.98, ranging from a minimum of 0.021 to a maximum of 863.195.

Discussion

The scatter plots Figures 1a, 1b and 1c show a number of interesting connections between government education expenditure and unemployment. It is clear that government education expenditure negatively correlates with unemployment suggesting that a higher level of government education expenditure contributes to a lower unemployment rate.

The scatter plots Figures 2a, 2b, and 2c show an interesting connection between government education expenditure and the happiness index. It is clear that government education expenditure positively correlates with unemployment suggesting that a higher level of government education expenditure contributes to a higher happiness index.

The scatter plots Figures 3a, 3b, and 3c show an interesting connection between government education expenditure and the happiness index. It is clear that government education expenditure positively correlates with unemployment suggesting that a higher level of government education expenditure contributes to a higher happiness index.

Table 2 presents the result in five different regression models, where the dependent variable is unemployment. Each column corresponds to a distinct model with varying explanatory variables. If the results are statistically significant, at 1 percentage level, we indicated by (***), the 5 percentage level (**), and the 10 percentage level (*).

In model 1, Government expenditure on education as % of GDP (GovExp) is negatively associated with unemployment as % of the total labour force (UnEmp), with a coefficient of -0.2165. The finding suggests that the higher level of government expenditure on education is linked to lower unemployment as % of the total labour force.

In model 2, GovExp is consistently negatively associated with UnEmp at the 1 percentage level with the coefficient of -0.2456 highlighting their robust contribution to UnEmp after controlling the effect of GDP per capita growth as annual % (GDPperGrowth).

In model 3, GovExp is still negatively associated with UnEmp at a 10 per cent level with the coefficient of -0.2222 after controlling the effect of traditional determinants of UnEmp such as GDPperGrowth and Real interest rate (%) (InterestRate).

In model 4, GovExp is still negatively associated with UnEmp. The statistical significance of this result at 1 percentage level suggests a negative correlation between GovExp and UnEmp. The result is consistent after controlling the effect of Inflation as consumer price index (Inf) in addition to GDPperGrowth and InterestRate.

In model 5, GovExp has a statistically negative effect on UnEmp consistent with the previous four models. The statistical significance of this result at 1 percentage level suggests a negative correlation between GovExp and UnEmp. The result is consistent after controlling the effect of Trade as % of GDP (Trade) in addition to GDPperGrowth, InterestRate and Inf.

The result of regression analysis for UnEmp indicates that GovExp has a statistically significant effect on UnEmp. The result is consistent with all five different models.

Table 3 presents the result of five different regression models, where the dependent variable is income. Each column corresponds to a distinct model with varying explanatory variables. If the results are statistically significant, at 1 percentage level, we indicated by (***), the 5 percentage level (**), and the 10 percentage level (*).

In model 1, GovExp is positively associated with Income, with a coefficient of 5.1679. The finding suggests that the higher level of government expenditure on education is linked to higher income.

In model 2, GovExp is consistently positively associated with UnEmp at the 1 percentage level with a coefficient of 4.8062 highlighting their robust contribution to Income after controlling the effect of GDPperGrowth.

In model 3, GovExp is still positively associated with Income at 1 percentage level with the coefficient of 4.3206 after controlling the effect of traditional determinants of UnEmp such as GDPperGrowth and InterestRate.

In Model 4, GovExp is still positively associated with Income. The statistical significance of this result at 1 percentage level suggests a positive correlation between GovExp and Income. The result is consistent after controlling the effect of Inf in addition to GDPperGrowth and InterestRate.

In model 5, GovExp has a statistically positive effect on Income consistent with the previous four models. The statistical significance of this result at 1 percentage level suggests a positive correlation between GovExp and Income. The result is consistent after controlling the effect of Trade in addition to GDPperGrowth, InterestRate and Inf.

The result of regression analysis for Income indicates that GovExp has a statistically significant effect on Income. The result is consistent with all five different models.

Table 4 presents the result of five different regression models, where the dependent variable is the Happiness index (Happ_Idx). Each column corresponds to a distinct model with varying explanatory variables. If the results are statistically significant, at 1 percentage level, we indicated by (***), the 5 percentage level (**), and the 10 percentage level (*).

In model 1, GovExp is positively associated with Happ_Idx, with a coefficient of 6.0514. The finding suggests that the higher level of government expenditure on education is linked to higher Happ_Idx.

In model 2, GovExp is consistently positively associated with UnEmp at the 1 percentage level with the coefficient of 6.1972 highlighting their robust contribution to Happ_Idx after controlling the effect of GDPperGrowth.

In model 3, GovExp is still positively associated with Happ_Idx at 1 percentage level with the coefficient of 6.0560 after controlling the effect of traditional determinants of UnEmp such as GDPperGrowth and InterestRate.

In model 4, GovExp is still positively associated with Happ_Idx. The statistical significance of this result at 1 percentage level suggests a positive correlation between GovExp and Happ_Idx. The result is consistent after controlling the effect of Inf in addition to GDPperGrowth and InterestRate.

In model 5, GovExp has a statistically positive effect on Happ_Idx consistent with the previous four models. The statistical significance of this result at 1 percentage level suggests a positive correlation between GovExp and Happ_Idx. The result is consistent after controlling the effect of Trade in addition to GDPperGrowth, InterestRate and Inf.

The result of regression analysis for Happ_Idx indicates that GovExp has a statistically significant effect on Happ_Idx. The result is consistent with all five different models.

Conclusion

The study reveals a significant relationship between government education expenditure and the key socioeconomic indicators, including unemployment, income and happiness. The regression analysis consistently indicates that higher education spending is associated with lower unemployment rates, suggesting that investment in education can be an effective strategy for reducing unemployment. Furthermore, the positive correlation between government education expenditure and income levels implies that increased education spending can relate to higher income. The findings also emphasise the importance of education spending for enhancing social well-being as indicated by the happiness index. Thus policymakers should consider these findings that education expenditure has a significant effect on socioeconomic well-being.

Future research could expand on this analysis by incorporating longitudinal data and exploring the interaction effect of different types of government spending on socioeconomic outcomes.

Appendix

Appendix 1. Definition of variable.

Indicator name	Variable	Definition	Source
UnEmp	Unemployment, total (% of total labour force (modelled ILO estimate))	Unemployment refers to the share of the labour force that is without work but available for and seeking employment.	World Bank: WDI
Income	Adjusted net national income per capita (current US\$)	Adjusted net national income is GNI minus consumption of fixed capital and natural resources depletion.	World Bank: WDI
Happ_idx	Happiness index	Share of people who respond they are "very happy" or "rather happy" to the question "Taking all things together, would you say you are ... ?"	https://ourworldindata.org/happiness-and-life-satisfaction
GovExp	Government expenditure on education, total of GDP	General government expenditure on education (current, capital, and transfers) is expressed percentage of GDP.	World Bank: WDI
GDPperGrowth	GDP per capita growth (annual %)	Annual percentage growth rate of GDP per capita based on constant local currency. GDP per capita is gross domestic product divided by midyear population.	World Bank: WDI
InterestRate	Real interest rate (%)	The real interest rate is the lending interest rate adjusted for inflation as measured by the GDP deflator. The terms and conditions attached to lending rates differ by country, however, limit their comparability.	World Bank: WDI
Inf	Inflation, consumer prices (annual %)	Inflation as measured by the consumer price index reflects the annual percentage change in the cost to the average consumer of acquiring a basket of goods and services that may be fixed or changed at specified intervals, such as yearly.	World Bank: WDI
Trade	Trade (% of GDP)	Trade is the sum of exports and imports of goods and services measured as a share of gross domestic product.	World Bank: WDI

Aircraft Engine Fault Detection Using YOLO Based Methods By Arav Sakthivel

Abstract

Aircraft maintenance is a regular task that requires precision, attention to detail and diligence. Presently, the regular check and servicing of aircraft in between flights is quite minimal, owing to quick turnaround times and tight budget constraints of airlines. However, there are chances that small issues that occur during the flights in between long periods of regular maintenance can amount to costly damages and may often be hazardous and fatal. I have tried to develop an AI based method to perform aircraft maintenance with a hands-off approach and requires minimal supervision. I am using a variant of CNN architecture - called the YOLO(You Only Look Once) based model. Our model is quite good at prediction of four different kinds of issues in the aircraft engines. We are able to achieve mAP value of over 0.35, with extremely sparse datasets.

Keywords: CNN, Object Detection, YOLO, Aircraft Maintenance

Introduction

Engine maintenance, or overhauls[7], is a critical aspect of aircraft upkeep, performed at specified intervals mandated by manufacturers and the Federal Aviation Administration (FAA). In the U.S., the FAA regulates aircraft maintenance programs, establishing the operational limits for engines. For instance, if an engine has a lifespan of 1,000 hours and has been used for 250 hours, it has 750 hours remaining before it requires an overhaul. Operating beyond these limits can lead to engine deterioration, posing significant safety risks.

Conducting regular overhauls is essential for preventing malfunctions[9], minimizing downtime, and averting catastrophic failures. It extends aircraft lifespan, reduces operational costs, and ensures compliance with aviation regulations. Effective maintenance allows for the early identification of minor issues before they escalate into major problems that could cause accidents or disrupt operations.

There are various types of maintenance checks[8]

- **Line Based Checks** are routine, including post-flight and pre-flight checks.
- **A Level Checks** occur every 400-600 flight hours or 200-300 flights, focusing on general inspections for damage or corrosion.
- **B-Checks** are conducted every 6-8 months, while **C-Checks** are more thorough, occurring every 20-24 months. **D-Checks**, the most comprehensive, happen every 6-10 years.

The engine overhaul process consists of several critical steps to ensure the engine is restored to optimal condition. It begins with receiving inspection, where the engine's condition is evaluated, and a full inventory of components is taken. This step helps in determining the

necessary actions and verifying the completeness of the engine.

Necessary actions include verifying the completeness of the engine. Next is disassembly, where each part of the engine is carefully separated and laid out in an organized manner to avoid further damage. Containers may be used to store parts securely. After disassembly, a visual inspection is conducted to identify any visible damage, such as abrasions (areas of rough scratches or marks typically caused by foreign matter between moving parts or surfaces), burrs (sharp or rough metal projections usually resulting from machining), or scratches (shallow, thin lines or marks of varying depth and width caused by foreign matter or contact between moving parts).

Cleaning is then performed to remove any contaminants and metal particles from the engine parts. Structural inspections follow, employing advanced methods like magnetic particle, dye penetrant, eddy current, ultrasound, and x-ray testing to detect any hidden damage or cracks that might compromise engine integrity.

Once inspections are complete, repairs are made, and the engine is reassembled. It's crucial to reference the parts catalog to ensure the correct hardware is used during this phase. The final step is testing the reassembled engine to verify its reliability, identify potential future issues, and ensure long-term performance. After the reassembled engine is tested and its performance is verified, attention shifts towards optimizing maintenance procedures. As engine systems become more complex, traditional manual inspections and repairs can lead to inefficiencies. This is where automation steps in, revolutionizing maintenance practices.

Automation in maintenance[10] is crucial for optimizing efficiency, reducing downtime, and minimizing human error. By integrating AI, IoT, and advanced robotics, companies can predict equipment failures before they occur, enabling proactive maintenance strategies that keep operations running smoothly. This leads to reduced operational costs, extended asset lifespans, and improved safety standards, as machines handle dangerous tasks in hazardous environments.

Automation enhances data-driven decision-making by collecting and analyzing real-time data, allowing maintenance teams to focus on higher-value tasks while machines take care of repetitive processes. This boosts productivity and improves equipment reliability. By leveraging AI and real-time data, companies can shift from reactive to proactive maintenance strategies. This concept of automation inspired my project, where I applied similar techniques in defect detection, aiming to streamline the identification of issues in engine components and enhance maintenance efficiency.

My approach began by taking a dataset containing defects. I performed some basic pre-processing on the dataset. After pre-processing, I fed the images into a variant of Convolutional Neural Network (CNN) called the YOLO (You Only Look Once) model. The YOLO model progressively learned to extract more complex features, starting with simple edges and evolving to intricate defect patterns. I fine-tuned the model by adjusting hyperparameters, improving its accuracy in detecting engine defects while reducing false positives.

Background

In this paper [1], the authors have used Convolutional Neural Networks (CNN) to Automate Aircraft Maintenance Visual Inspection

CNNs integrated with autonomous drones offer a transformative approach to automating aircraft maintenance visual inspections. Traditional manual inspections are time-consuming and often require engineers to access difficult-to-reach areas using heavy equipment, increasing Aircraft-On-Ground (AOG) time and posing safety risks. Drone-based systems, equipped with CNNs, can address these challenges by rapidly scanning aircraft surfaces, including hard-to-reach areas like wings and control surfaces, significantly reducing inspection times and the need for personal protective equipment (PPE). This method has the potential to cut AOG time by up to 90% and enhance safety by minimizing the need for engineers to work in hazardous environments.

CNNs, such as Mask R-CNN, are particularly effective for object detection and image segmentation, making them ideal for identifying defects like dents, cracks, and lightning damage on aircraft. By leveraging data augmentation techniques—such as flipping, rotating, and blurring—paired with expert-labeled datasets, CNN-based models can achieve high accuracy and objectivity, reducing the likelihood of human error caused by fatigue or time constraints. For example, this technology has demonstrated the ability to reduce lightning strike detection time by 75% compared to manual methods.

Ongoing research aims to improve these systems by exploring more advanced CNN architectures, such as U-Net with attention mechanisms, to further enhance detection performance. The integration of CNNs and autonomous drones in aircraft maintenance represents a significant advancement, improving efficiency, accuracy, and safety, while reducing costs and operational downtime

In this paper [2] the authors have used the method of Inception CNN to predict the defects in aircraft engines. Aero-engine systems are characterized by complex architectures and harsh operating conditions, making reliable sensor performance critical for system health monitoring. Sensor faults account for over 80% of aero-engine control system failures, underscoring the need for effective fault detection and isolation (FDI) methods. Traditional sensor fault detection algorithms, such as Kalman filters and particle filters, often rely on complex models with numerous parameters. While effective in controlled environments, these methods face challenges in practical applications due to the complexity of aero-engine systems and the variability in sensor data.

Recent advances in machine learning, particularly convolutional neural networks (CNNs), have shown promise in improving fault detection accuracy. CNNs are well-suited for extracting features from multidimensional data, and their self-iterative nature reduces the need for manual parameter optimization. However, traditional CNN architectures have limitations in detecting sensor faults, especially in systems with multiple sensors and diverse operating conditions.

To address these challenges, this study proposes an Inception-based CNN architecture designed to extract redundant information between sensors through convolution kernels of

different sizes. By fully leveraging this information, the proposed model aims to improve fault detection accuracy and simplify the traditional FDI process, which typically relies on multiple fusion algorithms. In addition, the use of Monte Carlo simulations for generating synthetic sensor fault datasets enables the model to train on a larger volume of data, overcoming the scarcity of real-world fault data. This approach provides a data-driven solution to enhance FDI performance in aero-engine systems.

Dataset and Pre-Processing

I have obtained our dataset from Kaggle which is an aero engine image based dataset with labels for the purpose of fault identification using CNN based models. I am attaching a direct access link for the dataset, as it has been removed from Kaggle, since I last checked[3]. The dataset consists of images of aircraft engines taken from multiple orientations. It has 239 total sets of images. The images are dispersed amongst more than 30 different aircraft engines. The amount of images per engine is roughly around 4-6, along with that there are some more component parts also included in the images. For each image - there is a corresponding .txt file. The file has the labels and the bounding box of that label provided in the standard format of COCO dataset. The dataset has four classes namely -scratch, damage, stain and dirty, I have splitted the dataset in the 80-20 fashion for training and validation. I have a different dataset by name validation also available but I did not take it for our purpose. The reason for not taking it is because the labels of the dataset over there are actually different from the training and hence would be unnecessary. Figure 1 illustrates the dataset and Figure 2 illustrates how the labels are designed to detect faults. I also did run an edge detector on the dataset extracting the edges, this is shown in Figure 3, whereas the distribution of the different kinds of defects are shown in Figure 4

Figure 1: Sample of dataset - Aircraft Engines

Figure 2: Dataset sample with the annotated labels of the defect found in the engine parts.

In the dataset I was using, I encountered a situation where I had a one-to-many mapping between data and labels, meaning that each data point could correspond to multiple labels. Initially, I attempted to address this issue using a multi-label binarizer, which is a technique often used in multi-label classification problems. A multi-label binarizer transforms the labels into a binary format, where each label is represented as either a 0 or 1. This allows for handling situations where a single instance can have multiple labels, such as predicting both "dog" and "cat" for an image containing both animals.

However, the multi-label binarizer wasn't ideal in my case because it led to issues with imbalanced label distribution and label overlap. The binary format didn't fully capture the relationships between certain labels, which caused a decline in model performance when dealing with complex, overlapping labels.

To resolve this, I switched to a more sophisticated annotation approach using the COCO (Common Objects in Context) method. COCO is widely used in object detection and segmentation tasks and stores annotations in a structured JSON format. The COCO method allows for more detailed labeling, including bounding boxes, segmentation, and keypoints, which helped me manage the complex labeling situation more effectively. This structure also better accommodates one-to-many mappings, providing a more accurate representation of the data.

Additionally, the model I built was designed to be lean and lightweight, which offered several key benefits. A lightweight model requires fewer computational resources, making it

easier to deploy on devices with limited processing power, such as smartphones or embedded systems. It also reduces training time and memory usage, allowing for quicker iterations during model development. Despite being smaller, such models can still achieve high performance when optimized effectively. This combination of efficient data annotation with a lean model resulted in a more robust and scalable solution.

Methodology

Convolutional Neural Network

Convolutional Neural Networks (CNNs) are a specialized type of neural network

designed primarily for processing and classifying images. These networks are particularly powerful in handling image data due to their ability to capture spatial hierarchies and patterns within images. The main feature of CNNs are convolutional layers, which are pivotal in processing image data. Convolution involves applying filters (kernels) over the input image. Kernels are small matrices that move across the image and perform element-wise multiplication with the pixel values. This operation helps in extracting features such as edges, textures, and shapes. The specific values in the kernel depend on what feature the network is designed to detect. In color images, there are three different matrices corresponding to the RGB channels, each processed separately during convolution. The stride determines how much the kernel moves across the image. By changing the stride, you can modify the size of the output feature map, which can be useful in controlling the amount of information retained.

Padding involves adding extra pixels around the edges of the image before applying the convolution operation. This technique helps preserve spatial information at the borders, ensuring that features near the edges are not lost, and it can also increase the output size.

Pooling layers reduce the dimensionality of the feature maps while retaining important information. The most common types of pooling are max pooling and average pooling, where the maximum or average value within a window is selected to represent that region. This operation makes the network less sensitive to minor variations in the image, such as small translations. After the convolutional and pooling layers, the data is typically flattened into a single vector, making it compatible with dense (fully connected) layers. These dense layers take the high-level features extracted by the convolutional layers and integrate them into the final prediction. Flattening reduces the multi-dimensional data into a single dimension, which is crucial for the classification phase.

One Hot Encoding

One-hot encoding[4,5] is a technique in machine learning used to transform categorical data into a numerical format. Categorical variables represent discrete values, such as "color" or "city," which cannot be ordered meaningfully. One-hot encoding solves this by assigning each category a unique binary vector. For example, if a dataset contains three weather conditions—sunny, rain, and wind—one-hot encoding will represent these as [1,0,0], [0,1,0], and [0,0,1], respectively.

This process allows machine learning algorithms to work with categorical variables that they would not otherwise handle, as they often expect only numerical inputs. Each category is given its dimension, with 1 representing the category in question and 0 representing all others. While this method is simple and effective, it can lead to increased dimensionality and sparsity, especially if the dataset contains many categories or multiple categorical features. As a result, machine learning models may become slower, and training complexity can increase.

\ One-hot encoding is generally advantageous for models that are sensitive to ordering, as it avoids assigning arbitrary numerical values that could suggest a false ranking. However, it's important to balance the trade-off between representation accuracy and computational efficiency

when using this technique, particularly with large datasets. In some cases, methods like label encoding or techniques that reduce dimensionality are preferable to maintain performance without excessively increasing the size of the feature space

YOLO Model Architecture & Design

The YOLO (You Only Look Once) algorithm operates as a single neural network model for real-time object detection, designed to consolidate object classification and localization tasks into a single pass over the input image. This model's structure consists of three primary components: the backbone, neck, and head, each fulfilling distinct roles in feature extraction, processing, and output generation.

1. **Backbone** The backbone comprises a series of convolutional layers that process input images to extract relevant features. These layers are initially trained on an image classification dataset, typically at a lower resolution, then fine-tuned at a higher resolution for object detection, accommodating the additional spatial detail required for bounding box prediction.

2. **Neck and Head** The neck processes features extracted from the backbone, utilizing fully connected layers to produce bounding box coordinates and confidence scores. The head forms the final layer of YOLO, outputting a tensor with shape $S \times S \times (C + B \times 5)$, where S is the grid size, C represents classes, and B the number of bounding boxes. YOLOv1, for instance, divides the image into a 7×7 grid, predicting two bounding boxes and one class per grid cell.

Image Processing and Detection in YOLO

In YOLO's detection process, the input image is divided into an $S \times S$ grid, and each cell predicts bounding boxes, confidence levels, and object classes. Bounding box predictions include x- and y-coordinates, width, height, and a confidence score, represented by Intersection over Union (IOU) between predicted and actual bounding boxes. Confidence scores range from 0 to 1, where values closer to 1 indicate higher model certainty. Each cell outputs a single class prediction based on a one-hot encoded vector of length C .

The model is trained on annotated datasets such as Pascal VOC, using modified squared sum loss functions to adjust for different types of prediction errors. Each bounding box prediction per grid cell is evaluated during training, and the bounding box with the highest IOU is selected as the responsible box. This targeted loss calculation approach allows YOLO to specialize bounding box predictions for diverse object shapes and sizes, optimizing detection accuracy across training epochs.

Limitations and Considerations

While YOLO demonstrates robust detection capabilities, it is limited by the number of bounding boxes and class predictions per grid cell. This constraint affects detection of small, densely-packed objects and multiple classes within a single cell, impacting applications with

overlapping or clustered objects. These methodological constraints form the basis for successive improvements in later YOLO versions, expanding YOLO's applicability in complex environments.

IOU & NMS

Intersection over Union (IOU) is one of the central ideas in YOLO based models to check for the performance of the model. Here we have our model check how correctly it detects the presence of the ground truth labeled bounding box over there. We define the idea of Precision and Average Precision based upon IOU.

Non Max Suppression (NMS) is a post processing technique to clean up multiple predictions of the same item. It is basically used to remove away the predictions that are not important or are of low confidence. It helps us to obtain a clear looking inference image in the output.

Results and Discussion

To assess the performance of our object detection models, we utilize Average Precision (AP), a standard metric in object detection tasks. AP measures the accuracy of models like Faster R-CNN (Region Proposal CNN) and SSD(Single Shot Detector) by computing the average precision across recall values from 0 to 1, providing a nuanced view of detection efficacy. The AP metric is derived from two key components: precision, which quantifies the accuracy of positive predictions, and recall, which reflects the model's ability to identify all positive instances. Additionally, we apply the Intersection over Union (IoU) metric to evaluate the spatial overlap between predicted and actual object boundaries, defining a true positive with an IoU threshold (e.g., 0.5). Mean AP or mAP[6] is the average precision implemented across multiple different classes It is one of the most common metrics used to measure object detection model performances. For my case we are going for mAP50, which means that IOU during the prediction of our model was at least 50%. We also have mAP 50-95, which measures the prediction from 50-95% during IOU. For my model, after training for over 100 epochs, we got the following results as shown in Table 1 and Figure 5 and 6 below.

mAP 50	0.383
mAP 50-95	0.262

Table 1: Performance result of our model

Figure 5 & 6: Output Inference after prediction on a trained model

The model prediction accuracy is not very high, but it is a result of several factors, as can be seen from the figure 4, above - the distribution of the dataset is quite skewed, and I couldn't do much about it, because the dataset from the beginning was very limited. Moreover, in the dataset we did have almost 20 images with missing labels. Lastly - The dataset was itself quite limited - just around 220 images which is not enough to train a model of this caliber. My model does hold the potential to scale up its performance.

Conclusion & Future Works

I wanted to solve the problem of autonomous maintenance of aircrafts and bring down human intervention while at the same time improve the accuracy of prediction of faults and damages over there. I built a YOLO based model for this task. My model working on an aircraft engine dataset was able to perform fault detection with quite considerable accuracy. I found that there are some possible sections of improvements in our work, like the dataset size and the dataset distribution of different classes of faults.

Acknowledgements

I would like to thank my mentor, Zeeshan, a graduate student at the University of Pennsylvania, for his invaluable guidance throughout this project. He has helped me understand the complexities of developing a large object detection model, introducing key concepts such as one-hot encoding, YOLO, and CNNs. Zeeshan also provided practical advice on overcoming challenges with the dataset and approaching model development more effectively. I am especially grateful for the time he dedicated to working directly on the model and for his patience in explaining various methods. Despite his busy schedule, he consistently made time for Zoom sessions, which made a tremendous difference in my learning experience.

Understanding the Link Between Childhood Abuse and Onset of Obsessive-Compulsive Disorder: Role of Parenting, Trauma, and Biological Factors By Judy Wang

Abstract

Childhood abuse can significantly contribute to the development of obsessive-compulsive disorder (OCD). This literature review paper discusses the possible causes of OCD by investigating the link between childhood abuse and the onset of OCD. Specifically, the impacts that parenting, trauma, and biology have on OCD development and severity are examined. By analyzing previous research studies, this paper aims to provide insight into how childhood experience can shape psychological outcomes and their implications for future treatment. This review also examines the biological markers involved in stress-related situations that may predispose an individual to OCD or exacerbate symptoms. The relationship between environmental factors and biological changes is assessed by doing so. Understanding these relationships can support the identification of groups who are at risk and raise awareness about early prevention strategies for people affected by childhood trauma.

Introduction

Obsessive-compulsive disorder (OCD) is a chronic mental condition characterized by persistent, intrusive thoughts that cause a significant amount of anxiety. These obsessions are commonly followed by repetitive behaviors or rituals, known as compulsions, in an attempt to ease or neutralize the obsessive thoughts. Both obsessions and compulsions can be time-consuming and distressing for the individual (1). The lifetime prevalence of OCD globally is 2-3% of the total population (2) and typically has an earlier onset than other psychiatric conditions. Specifically, roughly 8 in 10 of those with OCD have an onset before the age of 18 (3). A meta-analysis by Sharma and colleagues (2021) examined the rates of comorbidity, or simultaneous presence of more than one condition, with other psychiatric conditions among individuals with OCD. The result of this work found that 60% of the pooled sample of people with OCD had any psychiatric comorbidity. The most common comorbidities were mood disorders, with a 48% prevalence, and anxiety disorders, with a pooled prevalence of 32% (4). These results highlight high rates of comorbidity in OCD with other psychiatric conditions. Recent research has aimed to identify whether there is a developmental subtype for pediatric cases of OCD. While an exact definition has not yet been established, the differences between pediatric-onset and adult-onset OCD continue to be investigated across many distinct factors (5).

Early life experiences can set the stage for mental health challenges later in life, shaping how individuals perceive and respond to stress, form relationships, and manage emotions. Understanding the impact of childhood experiences on child development is crucial in identifying risk factors and implementing early interventions to promote mental well-being. Childhood trauma can be physical, emotional, or sexual abuse and can have long-lasting effects on the child's mental health. Numerous meta-analyses and systematic reviews point to the

association of childhood exposure to trauma and the development of psychological disorders, including OCD (6) as well as depression (7), anxiety (7), post-traumatic stress disorder (PTSD) (8), and alcohol and drug dependence (9). Recent studies demonstrate a link between exposure to childhood trauma and obsessive-compulsive symptom severity (6). This work also supports that those with both childhood trauma and OCD had symptoms with higher severity even after treatment (10). Although this association has been established, the exact role that trauma plays in OCD remains unclear.

A less widely studied potential risk factor for OCD is the effect of parenting style and structure on the onset of the disorder. Parenting is a significant factor in development during childhood. A parenting model created by Baumrind characterized three different parenting styles: authoritarian, authoritative, and permissive (11). Research suggests that authoritative parenting, which is defined as nurturing and supportive with firm boundaries, may be the most beneficial to childhood development in terms of behavior (12), achievement (13), and mental health (14, 15). Research also points to authoritarian parenting, characterized by harsh parenting practices and low warmth, as having the most adverse effects on childhood development. Some research suggests that parenting style does have an association with OCD, specifically in terms of higher levels of OCS (16). Other studies, like the longitudinal twin study performed by Krebs and colleagues, found that parenting, specifically punitive parenting, was not a predicting factor for the development of obsessive-compulsive symptoms (17). Instead, stressful life events were compounded as the significant predictor for developing these symptoms.

Another factor important to consider in understanding the relationship between OCD and childhood trauma is the impact that stress has on the biological workings of the brain in individuals with OCD. This may provide information on how the other risk factors, specifically parenting and trauma, affect biology in ways that contribute to the development of OCD from childhood into adulthood. One crucial system in the brain that plays a significant role in complex behaviors is the corticostriatal-limbic circuitry, comprising the frontal cortex, amygdala, and basal ganglia (18). Within this circuit, important brain areas work together to execute planned and motivated behaviors. The structures in this circuit collaborate to plan and perform behaviors and coordinate the emotional and motivational factors that underlie these actions. The amygdala, a key component of this circuit, influences emotions, controls motivation levels for goal-directed behavior, and is a structure heavily implicated in response to trauma (18, 19). While there are a range of factors that may contribute to the onset of OCD, there are similarities in biological effects that could potentially shed light on how stress affects the brain in OCD patients and what this might imply for those who have experienced adversity in childhood.

This literature review aims to synthesize the understanding of the factors that underlie obsessive-compulsive symptoms (OCS), OCD onset, and development in children and adolescents. Specifically, this review aims to develop a greater understanding of the impacts of trauma, parenting, and biology on OCD in pediatric populations. By focusing more on these factors, the importance of childhood events and stress as environmental risk factors for OCD can be correlated.

Methodology

Areas of interest for this review included the effects of parenting styles, trauma, and genetic factors on the development and symptomatology of OCD, as well as neurobiological changes in individuals with OCD. The literature search was conducted using Google Scholar as the primary database. The keywords used to access the data included childhood abuse, trauma, parenting, OCD, PTSD, and development. The results were screened for relevance to the area of interest and then narrowed down by inclusion criteria for final selection to thoroughly review.

Inclusion criteria included controlled studies, systematic reviews, and peer-reviewed journal academic sources; research that was performed between the years 2000 and 2024; studies that discussed the role of childhood abuse, parenting, and/or trauma in the onset of OCD; and studies that reported on biological factors in relation to OCD. Exclusion criteria for papers included papers that did not directly investigate OCD, sources that did not include research on the relationship between trauma, parenting, or abuse and OCD, studies that lacked information on methodology or diagnostic processes, did not mention areas of interest, or were too limited in sample sizes and generalizability.

Results

The search yielded around 92,000 relevant papers. After an initial scan of titles and abstracts, 14 papers were chosen for full review. Of the initial results, ten papers met the inclusion criteria and were selected to be discussed in the final review.

Discussion

Childhood trauma

Traumatic experiences, particularly those involving abuse, can potentially lead to the onset or development of obsessive-compulsive symptoms because of their impacts on psychological development during childhood. A study by Mathews and colleagues (2007) (20) examined the relationship between childhood trauma and OCD in 938 undergraduate students. The authors used the Leyton Obsessional Inventory to measure obsessive-compulsive symptoms (OCS) and the Childhood Trauma Questionnaire to measure emotional abuse and neglect, physical abuse and neglect, and sexual abuse. The findings revealed that not only was there a significant association between childhood trauma and higher levels of OCS, but there was a specific emphasis on emotional abuse, physical abuse, and physical neglect with the higher symptom levels. This indicates that with varying subtypes, childhood abuse is linked to OCS, which is a factor that underlies the development of OCD. Several previous works support that the severity of childhood abuse has impacts on symptomatology. For example, Boger and colleagues investigated how the severity of childhood maltreatment impacted OCD symptom severity and treatment outcomes (10). The results indicated that patients who experienced childhood maltreatment, particularly emotional abuse and sexual abuse, had higher OCD symptom severity before, during, and after treatment. However, it was also found that the level of maltreatment did

not make a difference in symptom improvement as an outcome of therapy. A focus on whether different kinds of abuse affect OCD development, like Mathews and colleagues' study, can support our understanding of what underlies the development of this disorder. A case-control study by Caspi and colleagues (2008) focused specifically on the link between childhood sexual abuse (CSA) and OCD by conducting semistructured interviews on groups of patients with OCD, panic disorder and a control group (21). Using the definition from the *Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition, Text Revision*, for pedophilia, the prevalence of both contact and non-contact CSA was measured in the patients. The study found that there was a significantly higher frequency of contact with CSA in the groups with OCD and panic disorder compared to those in the control. Overall, the research supports a substantial association between childhood trauma and the onset of OCD and OCS, especially with experiences of emotional, physical, and sexual abuse. These findings provide a path for future exploration of how specific types of abuse affect OCD symptomatology and treatment outcomes, which may give insight into options for OCD treatment.

Parenting

While childhood trauma has been established as a risk factor for the onset of OCD, there is evidence that parenting also plays a critical role in OCD development. Through a study of 227 undergraduate students, researchers Timpano and colleagues (2010) investigated the relationship between parenting styles and OCS with a particular focus on the authoritarian style, which they hypothesized was associated with higher levels of OCS (22). It also sought to understand how obsessive beliefs and cognition are affected by parenting because they are factors that underlie the development of OCD. Measures used for the study included the Parental Authority Questionnaire (PAQ), which assessed parenting styles; the Obsessive-Compulsive Inventory-Revised, which measured symptoms; and the Obsessive Beliefs Questionnaire for dysfunctional beliefs. The study's results confirmed the researchers' hypothesis that authoritarian parenting was associated with OCS. The results indicated a positive correlation between OCS and authoritarian parenting and a negative correlation between OCS and the authoritative style, but no statistical significance with the permissive style. Regression analysis also found that authoritarian parenting was a predictor for OCS, even after controlling for anxiety and depression.

Furthermore, obsessive beliefs such as perfectionism, responsibility, and control over thoughts were found to mediate the relationship between authoritarian parenting and OCS (22). The findings in this study suggest that certain types of parenting, especially those involving controlling and harsh traits, may influence the obsessive beliefs that mediate OCD. This study provides an important basis for future investigation of how family environment and parenting shape OCD. Future research, such as a longitudinal study that examines how specific parenting traits affect biology or the effects of reducing authoritarian parenting behaviors on psychological development, would help clarify the place that parenting takes up in OCD development.

Biology

The ways that stress affects OCD, through triggering or exacerbating its symptomatology, is also an important factor to address. Adams and colleagues (2018) reviewed the role that stress plays in OCD on the neurobiological level, finding that stressful life events and trauma exposure can disrupt areas in the brain through either atrophy or hypertrophy, particularly in the limbic and cortical-striatal circuitry (23). Adams discusses that when specific structures in these regions experience decreases or increases in volume size, it can lead to symptoms that characterize OCD. Specifically, in OCD patients, increased gray matter was seen in the dorsal striatum and thalamus, areas linked to habits and feedback loops. The hyperreactivity in these areas is related to habitual behavior, such as repetitive grooming (24, 25).

Additionally, in individuals with OCD, areas in the frontal cortex that help direct goal-related decision-making were seen as atrophied, suggesting that individuals with OCD struggle more to switch smoothly between goal-directed behavior and habitual behavior (26). The Adams review also discussed that stress can cause hypertrophy and increased activation in the amygdala. As a structure associated with fear and habits, disruption in the amygdala can cause an abnormal bias toward habitual behavior. Abnormality in structures in the cortico-striatal limbic circuitry can also dysregulate the connectivity of these important structures, affecting how they function under one another (27). Additionally, in one study conducted by Edmiston and colleagues, exposure to childhood maltreatment, specifically childhood trauma, was associated with corticostriatal-limbic gray matter reductions in adolescents (28). This highlights the effect that stress has on the child's brain, specifically in areas that are connected to characteristics seen in OCD. Overall, the findings from the research papers described by Adams present the idea that the experience of stress affects areas of the brain that are linked to OCD symptoms, especially with habit-forming tendencies. This may indicate that stressful life events such as childhood trauma and abuse impact the brain in ways that contribute to OCD symptoms, potentially explaining the underlying biological mechanisms of the onset of OCD.

Limitations

Limitations of the studies included in this review should be considered, as they may affect the interpretation of the results and the conclusions drawn about what factors influence the development of OCD. First, several of the studies used participants who were undergraduate students, as seen in the research done by Mathews and colleagues and Timpano and colleagues. While these participants can provide insights into the relationship between trauma or stress and OCD, the findings may not be generalizable to the overall population. This can be seen in the demographic makeup of the sample in the study done by Timpano, which was 76% female and 70.3% white. The lack of diversity may limit the generalizability of the findings to other racial, ethnic, and gender groups. Since experiences of childhood trauma can vary across different genders and racial or cultural identities, a focus on diversity in future studies would help to create more generalizable results.

Second, studies were included that used self-reports to assess the prevalence of factors such as childhood abuse and trauma. Self-reported data may affect the reliability and validity of the findings due to the vulnerability of this data to biases. As mentioned by Caspi and colleagues in their study of the association between CSA and OCD, their findings on the prevalence rates of CSA in the groups of patients were impacted by the study's retrospective nature. This may have included individual cognitive distortions that affect their memory of their childhood experience or the possibility that the psychiatric patients, compared to the controls, were more likely to self-report their experiences due to both their higher exposure to reporting past information and their motivation to attribute their illness to external factors.

Third, while the studies discussed childhood trauma did find an association between trauma and the general onset of OCD, they did not determine whether different types of trauma were predictors for pediatric cases of OCD rather than adult cases. This would be a point of focus that would benefit our understanding of whether pediatric OCD presents a subtype of OCD.

Future Directions

Future work should focus on replicating and extending the findings presented here. Specifically, future work should utilize more diverse samples that extend beyond undergraduate students. Expanding the sample demographics would allow for better generalizability of the results in different demographic backgrounds. Future studies should also utilize objective measures of OCD either instead of or in addition to subjective self-report measures. This incorporation could create a more accurate measurement of OCS while reducing the biases common to self-reporting (e.g., memory bias and motivation to attribute illness to external factors). Lastly, future research should examine the effects of the different types of trauma on OCD development because distinct experiences of trauma have the potential to impact different individuals uniquely. Approaching future research through the implementation of these factors can provide a deeper understanding of the specific relationship between trauma and OCD symptomatology, which can support the improvement of treatment strategies.

Conclusion

In conclusion, this review aims to synthesize some of the information on the impacts that childhood trauma has on the development of OCD, with an emphasis on the factors of trauma, parenting styles, and neurobiology. Traumatic experiences can have drastic impacts on psychological conditions, especially during childhood. Research supports the idea that certain parenting styles, particularly authoritarian traits, may contribute to the underlying mechanisms that drive OCD development. Childhood trauma also plays a role, and this review highlights the need for future studies that are more generalizable and specific to consider the possibility that different types of childhood trauma have unique psychological impacts. Studies on the neurobiology behind OCD symptomatology also reveal the possible effects that stress caused by traumatic experiences has on structures of the brain that control habitual and repetitive behavior.

Overall, with an understanding of how experiences during youth shape the development of OCD and implications for future research, more focus can be put on early intervention measures and specialized forms of treatment.

Ambient Air Pollution's Effects on Epigenetic Mechanisms in Respiratory, Cardiovascular, and Immune Pathologies By Aadit Shrivastava

Abstract

Air pollution is the most significant environmental risk factor globally, causing changes in human gene expression and affecting many pathologies, including respiratory conditions, cardiovascular disease, and inflammation. Epigenetics is a major mechanism that changes gene expression, including DNA methylation, histone modifications, and regulation by non-coding RNAs. Previous research has focused on associations between pollutants and epigenetic biomarkers in the context of specific diseases, but there is minimal knowledge of the cellular mechanisms behind these relationships. Exploring pathways that lead to epigenetic modifications implicated in disease can reveal more possibilities for treatments and preventative measures. This paper discusses air pollution and associated epigenetic modifications, signaling pathways, human diseases, and therapeutic targets. The global impact of air pollution makes it a relevant issue, especially given the limited body of research on the role of environmental factors in epigenetic modifications.

Introduction

According to the World Health Organization (WHO), 92% of people breathe unhealthy air that exceeds its current guidelines for healthy air. These guidelines specify quantitative air quality guidelines (AQGs) for individual pollutants, notably particulate matter, ozone, nitrous oxides, sulfur oxides, and carbon monoxide (World Health Organization, *WHO Global Air Quality Guidelines*). If a city's air quality has pollutant quantities that surpass the AQGs, the air is deemed unhealthy by WHO guidelines. Excessive quantities of air pollution primarily result from industrial and urban human activity. Since many unsustainable industrial practices are accepted globally as standard, the resulting pollution accumulates over time, especially in urban areas and developing nations with fewer clean, renewable energy sources. The air pollution emitted from such human activities significantly impairs human health. In fact, one out of eight premature deaths occur annually because of diseases caused by air pollution (World Health Organization, "7 Million Premature Deaths Annually Linked to Air Pollution"). One recently discovered effect of air pollution is changes in gene expression via epigenetic modifications (Toraño et al.).

Epigenetics is the study of changes in gene expression that do not result directly from alterations in the heritable DNA sequence itself (Dupont et al.). The three most common types of epigenetic mechanisms are DNA methylation, histone modifications, and non-coding RNA actions, as depicted in Figure 1 (Loscalzo and Handy). DNA methylation, the most well-known, occurs when methyl groups are added to DNA, namely to C5 in cytosine, by DNA methyltransferases. Generally, DNA methylation controls gene expression by methylation and demethylation of the gene's promoter region. Typically, but not always, methylation of a gene inhibits it (Jin et al.). Histone modifications include many post-translational modifications,

namely acetylation, phosphorylation, and methylation. Respectively, each process adds an acetyl, phosphate, or methyl group to an amino acid through specialized enzymes. Other enzymes remove these epigenetic tags (Duan). Non-coding RNAs (ncRNA) can be categorized as housekeeping or regulatory ncRNAs (Wei et al.). However, these control molecules and their effects on genetic processes remain the subject of ongoing research.

Fig 1: Three most common types of epigenetic modifications: DNA methylation, histone modifications, and ncRNAs. Created with Bio.Render.com.

This review will focus on five air pollutants: particulate matter, carbon monoxide, ground-level ozone, nitrogen oxides, and sulfur oxides. These are the five most prevalent types of ambient, or outdoor, air pollutants (World Health Organization, *Ambient (Outdoor) Air Pollution*). While other pollutants, such as volatile organic compounds, have been found to affect epigenetic modifications, there is not enough research on these pollutants concerning epigenetics to analyze for patterns in epigenetic pathways and physiological effects effectively. Particulate matter is a mixture of several substances, including aerosols, solid particles such as dust and smoke, and toxic compounds such as polycyclic aromatic hydrocarbons (Crinnion). The other four pollutants this review focuses on are also found in particulate matter but have research that investigates them independently. Particulate matter can be divided into three categories - PM₁₀, PM_{2.5}, and ultrafine particles - from largest to smallest. The other four compounds are smaller gas molecules. Their molecular formulas are shown in Figure 2.

Fig 2: Molecular visualization of four major air pollutants: SOX, NOX, CO, and O₃. Created with Bio.Render.com.

This review explores the effects of air pollutants on gene expression via epigenetics. First, a general idea of signaling pathways between air pollutants and epigenetic modifications is explored, and common epigenetic mechanisms triggered by air pollutants are outlined. Then, more specific descriptions of modifications implicated in human disease are listed, and the relationships between the many pathways are explained. Finally, treatments are discussed since epigenetics' reversible nature provides many development opportunities.

Air Pollution's Effects on Epigenetic Mechanisms

External factors are environmental or behavioral triggers foreign to the human body that cause disease. As previously mentioned, external factors modify gene expression through epigenetics. However, epigenetic alterations must be signaled within the body to affect biological processes. Like many other enzymatic processes, cells use signal transduction pathways to moderate epigenetic enzyme activity. Enzymes that add or remove epigenetic marks are regulated through these signaling pathways. As a result, epigenetic modifications directly affect gene expression by turning genes on or off or regulating mRNA transcription. Thus, epigenetic modifications act as a major gene regulator in the cell. Changes in gene expression may lead to problems that result in disease. Air pollutants are environmental factors. Regarding epigenetic markers, air pollution is most commonly associated with DNA methylation (Xu et al.). However, this finding is because DNA methylation has undergone the most research so far. Histone modifications and ncRNAs are also relevant in the epigenome but have been researched and discussed less.

Air pollution triggers several molecular pathways, the most important being oxidative stress and inflammatory pathways. Oxidative stress is the accumulation of reactive oxygen species (ROS). Many redox-sensitive pathways are then impacted by oxidative stress, leading to several varying biological processes, including inflammation or cell death (Lodovici and Bigagli). Several inflammatory pathways are activated by specific molecules, thus triggering immune responses. For example, poly-aromatic hydrocarbons, a class of compounds found in particulate matter, can activate many pathways, including aryl hydrocarbon receptors. These receptors respond to environmental stimuli by activating inflammatory responses as needed (Das and Ravi). Research linking inflammatory pathways with epigenetic modifications is still limited.

Because particulate matter is a mixture of many molecules, it can have a wide range of effects on gene expression in different bodily tissues through diverse epigenetic markers. Particulate matter decreases expression of DNA Methyltransferase 1 (DNMT1) - an enzyme that catalyzes the addition of methyl groups to CpG sites, found in most promoter regions of genes. Increased expression of DNMT3B also may occur, which is particularly important for DNA methylation in early mammalian development. Moreover, particulate matter increases histone acetyltransferase (HAT) activity, which transfers acetyl groups onto the lysine residues of transcription factors and histones. Histone modifications also include decreased histone deacetylase (HDAC) activity, which removes acetyl groups from lysine residues. Additionally,

miRNA alterations may occur, but further understanding is still developing in active research (J. Li et al.). The effects of particulate matter at a molecular level are difficult to discern since different individual components of particulate matter may have different effects.

Nitrogen oxides also have a host of epigenetic mechanisms associated with them. Nitrogen oxides cause the upregulation of DNMT, increasing DNA methylation at promoter regions and inhibiting the expression of downstream target genes. Additionally, HDAC is inhibited, causing increased histone acetylation. Inhibition of *KDM3A* (H3K9me2 lysine demethylase 3A) and *KDM2A* (H3K36me2 lysine demethylase 2A) decreases histone methylation (de la Cruz-Ojeda et al.).

Sulfur oxides, carbon monoxide, and ozone have less in-depth research concerning epigenetic mechanisms than particulate matter or nitrogen oxides. So far, sulfur oxides have been associated with hypermethylation, likely indicating overexpression of DNMT (Ji and Hershey). Also, SO₂ is associated with histone acetylation (Ding et al.). CO has been associated with DNA and histone methylation (Prunicki et al.; Yamamoto et al.). Ozone is associated with DNA methylation and microRNA alterations (Poursafa et al.; Iyer et al.).

Epigenetic Biomarkers & Disease

Air pollution has an extensive impact on health, including but not limited to diseases, disorders, and cancers in the pulmonary, respiratory, cardiovascular, and immune systems. As demonstrated later in this section, some epigenetic modifications that cause these diseases are expressed in specific genes through DNA methylation, and other modifications arise from histone proteins or specific ncRNAs. However, since the limited research in epigenetically-linked diseases mainly encompasses association studies, some modifications still need to be identified with distinct genes, histones, or ncRNAs.

The variety of epigenetically-linked diseases results from the connected nature of signal transduction pathways. Several proteins in the transduction pathway incite increased production of multiple other proteins, which control multiple possible pathways. Essentially, any changes to proteins involved in transduction pathways can affect numerous genes and, therefore, cause several characteristics and symptoms prevalent in disease. Figure 3 summarizes the bodily systems affected by air pollution, associated epigenetic modifications in an imprecise pie chart representation (pie charts are roughly produced and based exclusively on modifications listed in this paper), and resulting diseases. The examples listed below comprise various conditions to demonstrate the diversity of air pollution-induced gene expression changes.

Fig 3: Summary of bodily systems affected by air pollution associated with epigenetic modifications (pie charts are merely visual representations, not numerical) and resulting diseases. Created with Bio.Render.com.

Generally, air pollutants enter the body through the respiratory system, with the smallest particles able to penetrate the alveoli (Manisalidis et al.). In the lungs, bronchioles, and alveoli, several tissues can be impacted and cause a wide range of pulmonary and respiratory diseases. PM2.5 mediates promoter methylation of the tumor suppressor *p16* gene, promoter hypermethylation of *SOX2*, and miRNA-mediated dysregulation, causing lung cancer (Soberanes et al.; Tantoh et al.; Ning et al.). Additionally, PM2.5 also leads to DNA methylation in imprinted control regions (*L3MBTL1*, *NNAT*, *PEG10*, *GNAS*, *Ex1A*, *MCTS2*, *SNURF/SNRPN*, *IGF2R*, and *RBI*) causing non-small cell lung cancer (Liang et al.). PM2.5 also causes chronic obstructive pulmonary disease through altered global DNA methylation, p16 gene promoter methylation, DNMT activity, and altered post-translation histone modifications (Leclercq et al.). PM2.5, PM10, and ozone contribute to the hypermethylation of the *Foxp3* locus in asthma (Janssen et al.). PM2.5, PM10, NO₂, SO₂, and CO cause DNA methylation and histone H3K9 acetylation associated with several respiratory disorders and pulmonary cancers (Ding et al.; M. Wang et al.). Ozone causes pulmonary edema through DNA methylation of the *apelin* gene (Miller et al.).

Since pollutants penetrate the alveoli, they can also enter the bloodstream to affect the cardiovascular system through gas exchange with the pulmonary capillaries (Howden and Kleeberger). PM2.5 causes miRNA modifications, which lead to cardiovascular disease (Chen et al.). Also, mitochondrial DNA methylation causes heart rate variability (Byun et al.). Regulation of extracellular vesicle-enriched miRNA expression by DNA methylation leads to altered systolic blood pressure (Rodosthenous et al.). Altered methylation in clock genes (*CRY1*, *CRY2*, *NPAS2*) leads to ischemic stroke (Cantone et al.). Methylation at candidate CpGs in monocytes causes atherosclerosis (Chi, Liu, MacDonald, Barr, et al.). PM2.5 and nitrogen oxides cause CpG-methylation and DMRs in circulating monocytes, causing atherosclerosis pathogenesis (Chi, Liu, MacDonald, Reynolds, et al.). Genome-wide DNA methylation can even cause cardiometabolic diseases (H. Li et al.). *ICAM-1* promoter methylation leads to glucose dysregulation (Peng et al.). PM2.5, black carbon, NO₂, and CO contribute to cardiovascular disease through *LINE-1*, *Alu*, and gene-specific DNA methylation tissue factor (F3), Toll-Like

Receptor 2 (TLR-2), and ICAM-1 (Lisanti et al.). From PM10, microRNA-101 modifications cause changes in blood pressure (Motta et al.).

Both in the lungs and in continuing with the alveolar pathway into the bloodstream, many immune cells, including lymphocytes, neutrophils, and macrophages, are also affected (Glencross et al.). Moreover, lymph nodes in the lungs and respiratory tract are affected (“Effect of Air Pollution on the Human Immune System”). PM2.5 causes acetylation of H3K27 (histone 3 lysine 27), which triggers inflammatory responses (Liu et al.). Moreover, methylation alterations in *LINE-1* and methylation at CpG loci of TNF-alpha also cause inflammation (Cuicui Wang et al.). PM2.5 and PM10 cause inflammation through hypomethylation of tandem repeats SAT-alpha (Guo et al.). PM2.5 and nitrogen dioxide can also trigger inflammation and immune responses by DNA methylation on CpG sites and differentially methylated regions (DMRs) (Eze et al.). PM10 also causes inflammation through DNA methylation changes in macrophages (Miousse et al.). Additionally, PMs change extracellular vesicles and miRNAs, affecting inflammation and coagulation (Pavanello et al.). Ozone causes miRNA modifications (miR-132, miR-143, miR-145, miR-199a, miR-199b-5p, miR-222, miR-223, miR-25, miR-424, and miR-582-5p), leading to inflammatory diseases (Fry et al.).

Air pollution is also linked to neurological diseases but has minimal research. DNA methylation imprinted control regions cause not only non-small lung cancer but also glioma (Liang et al.). Ultrafine particles can affect noncoding RNAs, leading to neurodevelopmental and neurodegenerative disorders (Solaimani et al.).

Prenatal exposure to air pollutants can affect cardiovascular and respiratory health and increase cancer risk later in life. Prenatal exposure to PM2.5 causes cord blood DNA methylation of *IGF2* and *H19* genes and lowers miR-17/92 cluster expression levels in cord blood, leading to disease and cancer risk later in life (Congrong Wang et al.; Tsamou et al.). Exposure to PM2.5 and PM10 during pregnancy causes DNA methylation on CpG sites on DMRs, affecting respiratory health (Gruzieva et al.). Moreover, prenatal exposure causes altered DNA methylation in specific gene promoters, affecting childhood cardio-respiratory health (Breton et al.). Placental global DNA methylation also affects placental adaptation at the level of global DNA methylation (Maghbooli et al.).

These pathways all demonstrate molecular, cellular, and anatomical relationships. For example, hypermethylation of the p16 gene causes lung cancer in alveolar epithelial cells and COPD in bronchial epithelial cells. Since air pollutants travel through the respiratory pathway, they impact several tissues associated with the respiratory system. Another example in different bodily systems is that the same DNA methylation imprinted control regions cause non-small lung cancer and glioma. So, it can be inferred that the same molecule has consistently similar impacts on the epigenome regardless of the location in the body. Finally, diseases such as inflammation are caused by cumulative effects on the epigenome. These three observations are all known fundamental facts, but it is always good to draw out the connections.

Treatments

Despite air pollution-induced epigenetic modifications generally causing disease, the reversibility of epigenetic modifications suggests that treatments can be developed (Wright). Since external factors influence epigenetics, epigenetically-linked diseases can be effectively reversed by introducing pathway-inhibiting substances.

Generally, epigenetic therapy focuses on cancer, specifically with DNA demethylation inhibitors and histone deacetylation inhibitors. The most progress for treatments are for lymphoma and myeloma with phase III studies. Many of them are still under trials (Ahuja et al.). One investigation of treatments aims to look into using enzyme inhibitors to treat leukemia. One such example is that a mutated *MLL* gene induces DOT1L proteins to methylate histones, thus activating genes that cause leukemia. A study with a DOT1L inhibitor showed that many modified genes were reversed because DOT1L was not activated and that the inhibitor only killed cells with the mutated *MLL* gene (Wright). Both these experiments suggest that epigenetic modifications can be reversed by altering an epigenetic modification in terms of a reversible on-off switch in gene expression.

Moreover, this epigenetic therapy has also been applied in the context of air pollution exposure. For example, one study found that DNA methylation from fine particles in air pollution can be counteracted with a B vitamin supplement to prevent inflammation in T-helper cells. A trial exposed two groups of participants to PM2.5. One group took the supplement daily, and the other took a placebo. The supplement consisted of folic acid, B₆, B₁₂, as well as the amino acids methionine, betaine, and choline. The control group experienced inflammation because PM2.5 caused oxidative stress, leading to inflammatory responses. The group who took the B vitamin supplement did not experience any inflammation because the supplement counteracted PM2.5-induced oxidative stress (Zhong et al.).

Conclusion

Air pollution is a major environmental factor affecting epigenetic markers. These modifications are activated by signaling pathways that regulate epigenetic enzyme activity. Molecular changes directly caused by air pollutants impact these signaling pathways. As a result, many respiratory, pulmonary, cardiovascular, and immune diseases occur. Treatments that inhibit these pathways are the best-known method to prevent epigenetically-linked diseases. However, because of some knowledge gaps, there is not always clarity about these epigenetically-related pathways. Many pollutants may correlate with certain epigenetic modifications, but many of these relationships are not proven from a molecular standpoint.

Since air pollutants are significant in public health, developing treatments – affordable and manufacturable ones – is essential to minimizing deaths caused by such pollution globally. Considering that industrial pollutants are inevitable, the effects on healthcare can be minimized with further epigenetic research and application to produce accessible drugs and technologies to treat epigenetically-linked diseases. Therefore, understanding the characteristics of pathways and

molecules involved in them helps to analyze the causes of diseases at a molecular level. The reversible nature of epigenetics opens up the potential to interfere with epigenetic pathways.

Beyond medical research and development, more needs to happen regarding public health and environmental policy. Even if effective treatments are developed to minimize the health effects of air pollution, air pollution itself will continue to be prevalent in the atmosphere and persist as an issue. To truly end this issue, national and global steps must be taken to reduce industrial emissions and switch to cleaner energy sources. If the urgency to minimize industrial pollution increases, there will surely be a lower prevalence of many all-too-common diseases in the future.

Investigating the Link Between Multiple Sclerosis and Herpes Viruses (EBV/HHV-6)

By Surdish Randhawa

Abstract

Multiple Sclerosis is a chronic inflammatory disorder of the central nervous system. Infectious and non-infectious triggers including viruses that may cause Multiple Sclerosis are currently being investigated. Evidence from a plethora of studies strongly suggest that viruses such as Epstein-Barr Virus(EBV), and other Herpesviridae viruses play a role in the development of MS. Additionally, environmental and genetic factors may induce the condition, and have been strongly speculated of doing so for decades. This study firstly investigates biological mechanisms within viruses that have been shown to have a link to MS, and attempts to discover and connect those mechanisms with MS. Secondly, the study investigates worldwide prevalence and incidence rates, and compares those rates to different viruses. Lastly, it looks at environmental conditions in various high prevalence areas, and investigates if there are any similarities between environmental components in these areas.

Introduction

Multiple Sclerosis(MS) is a chronic autoimmune disease of the central nervous system(CNS) characterized by demyelination, damage to the protective covering of the myelin sheath, and can cause neurological dysfunction and other physical symptoms. In today's society where overall global travel is more prevalent, it becomes ever more crucial to determine epidemiologic trends between viruses and conditions that may debilitate and linger in a person's life. Yet, despite extensive research on MS, the exact etiology of the condition remains unclear, with the current consensus believing it results from a complex interplay of genetic and environmental factors. MS typically presents in people of ages 20-40, and is two to three times as prevalent in women as in men (1). MS has also been more prevalent in people of Northern European descent and less common in people of African, Asian, and South American descent. While genetic and environmental factors have been the main reasons for these occurrences, researchers have begun investigating the potential involvement of viral infections in the development and progression of MS. This paper focuses on the potential involvement of *Herpesviridae* viruses on the pathogenesis of MS. *Herpesviridae* is a family of double-stranded DNA viruses that causes several variants of clinical manifestations (2). Well-known, common herpesviruses include varicella zoster virus (which causes chicken pox and shingles) and herpes simplex virus, a sexually transmitted infection. Several studies have suggested that Herpesviruses may play a role in developing MS: experimental studies have evaluated the presence and biological mechanisms of these viruses in people with MS, and epidemiological studies have assessed prevalence and incidence. Currently, most research does not address the possible collective contributors of the family of *Herpesviridae* on MS pathophysiology, instead focusing on a specific member of the family (3). Therefore, this research hopes to synthesize

what research is available and communicate it in a novel way to enhance the existing literature connecting Herpes viruses and MS. This paper will evaluate the following:

I. Epidemiological Associations

Several epidemiological investigations have suggested a potential link between *Herpesviridae* infections and MS. For instance, elevated antibody titers against EBV have been observed in the bloodstream of individuals with MS compared to control groups, suggesting an association between MS and these viruses.

II. Potential Biological Mechanisms for MS

Herpesviridae viruses have multifaceted and complex mechanisms through which they may influence MS. Herpesviridae viruses are capable of molecular mimicry, which may trigger an autoimmune response since viral antigens share similarities with host myelin proteins (4). Molecular mimicry occurs when viral antigens share structural similarities, such as peptides, that resemble host proteins. Consequently, autoreactive T-cells may target both the virally-infected cells as well as the host's own myelin because of their similarities, causing auto-immune demyelination. In addition, Herpesviridae viruses are particularly capable at immune evasion, strategies that the virus uses to circumvent detection or destruction by the immune system (4). This capability can potentially lead to chronic mild inflammation in the CNS, with damage accumulating long-term and possibly contributing to MS development.. Furthermore, Herpesviridae viruses can induce epigenetic, which is altered gene expression, changes within host cells, potentially altering gene expression without changing the host's DNA sequence.

Molecular mimicry

Molecular Mimicry seems to have a role in the development of MS. Myelin Basic Protein (MBP) is thought to be the primary autoantigen that results in MS. Human herpesvirus 6 (HHV-6) DNA encodes for a protein called U24. U24 is able to activate CD4⁺ T-cells that recognize MBP, with 50% of these CD4⁺ T-cells being able to be activated by HHV-6 U24 (5). The capability of HHV-6's U24 protein being able to activate MBP recognizing T-cells suggests that HHV-6 is able to mimic activators of CD4⁺ T-cells and begin the demyelination process. EBV is also able to mimic host-proteins in order to activate EBNA-1 specific CD4⁺ T-cells (6). The EBNA-1 protein in EBV is very similar to the channel protein anoctamin-2, and both proteins have been shown to be cross-reactive with the T-cells (7).

While there is less accumulated evidence for other Herpesviridae viruses, cytomegalovirus (CMV) is another member potentially contributing to MS through molecular mimicry. CMV is able to activate auto-reactive T-cells, especially in people who have relapsing MS (8). It also has been shown to drive an autoimmune response which exacerbates the expansion of CD4⁺ T-cells, resulting in more T-cells for CMV to activate (Virtanen 2012).

Immune evasion

Immune evasion is a common approach leveraged by herpesviruses. For example, interleukin-10(IL-10) protein is an anti-inflammatory cytokine that prevents autoimmunity through the inhibition of T-cell growth (10). EBV vIL-10 hinders CD4+ T-cell activity, and is also capable of diminishing the ability of EBV-specific CD8+ T-cells for recognizing EBV. This supports the idea that EBV can suppress threats to its survival within a patient; consequently, it can evade immune responses and survive much longer in human cells. The ability of EBV to linger and, in doing so, establish a state of chronic inflammation, may lead to the development of MS. While there is no comprehensive literature surrounding immune evasion within other members of the Herpesviridae family, the similar DNA genome, structure, and characteristics imply that other members would be able to suppress immune responses to some degree.

III. General Epidemiology

The epidemiology of MS is essential to determine associations between it and other diseases. Primarily, the prevalence of MS was analyzed. It was determined that the prevalence of MS is highest in regions further from the equator, including North America, Europe, and parts of Australia. Within these high-prevalence areas, the estimated prevalence of MS ranged from 50-300 people per 100,000 population (11). Likewise, while certain Herpesviridae viruses, such as EBV, are found nearly universally, a higher prevalence has been demonstrated in regions farther from the equator, expressing a correlation between the prevalence of both conditions. A more comprehensive evaluation of the similarities in prevalence will be explored below. While MS is not considered an infectious or transmittable condition, Herpesviridae viruses spread through various modes of transmission, such as by direct skin-to-skin contact, and saliva.

IV. Meta-analysis as a quantitative study design

This paper is a meta-analysis to assess previous research on the hypothesized link between herpesvirus infection and MS. This paper identifies, synthesizes, and interprets the collective evidence. It provides an efficient way of systematically analysing the significance of the collected data.

Methodology

A necessary preliminary step for conducting a meta-analysis is the identification and vetting of the relevant original research to include. This research compiles papers identified with both Google Scholar and PubMed. The strategy followed two steps: first, all articles were identified with the same structure of keywords. Second, the articles, and the references in these articles were used to compile data. To ensure recency, only articles written in the last 30 years (since 1984) were included.

In order to evaluate the general epidemiology surrounding MS, the data synthesized was searched on PubMed and Google Scholar with specific keywords. To synthesize data about EBV serum count, the keywords “Multiple Sclerosis,” “serology EBV IgG” were used. Serum immune globulin G (IgG) was used instead of any other form of immunoglobulin because it is

the primary immunoglobulin that persists in the body. Many other immunoglobulins lose efficacy soon after the person recovers from the infection, making it difficult to detect long-time trends without serum IgG counts. A similar synthesis of data was conducted to determine the role of molecular mimicry in MS; PubMed and Google Scholar were used and the keywords “Molecular Mimicry, Multiple Sclerosis, EBV” were used. The same format was followed for all studies searched for molecular mimicry, except the EBV was substituted for alternative Herpesviridae viruses such as HHV-6. For the prevalence of MS, the data was synthesized by applying the keywords “Multiple Sclerosis” and “prevalence.” Similarly for EBV, the keywords “Epstein-Barr Virus” and “seroprevalence” were used.

Results

Figure 1 shows the mean % of EBNA-1 antibodies in patients with MS and healthy patients from seven studies conducted to evaluate the presence or absence of serum IgG in a number of patients (Table 1). Error bars measure to CI 95%(2 SEMS)

Serum IgG count of EBV in Multiple Sclerosis and Healthy Groups

Isr Med Assoc J. 2018 Feb;20(2):86-90. PMID: 29431301.	To analyze the seroprevalence of EBV infection in different population groups in Croatia.	During a 2 year period, a total of 2022 consecutive serum samples were collected from Croatian residents and tested for the presence of EBV-specific viral capsid antigen(VCA) immunoglobulin M(IgM) and IgG antibodies using an enzyme-linked immunoassay.	The overall prevalence of EBV IgG antibodies was 91.4%. The IgG seroprevalence was 95.9% in adults; multiple sclerosis(100%)

John Lindsey	Lindsey JW, Hatfield LM, Vu T. Epstein-Barr virus neutralizing and early antigen antibodies in multiple sclerosis. <i>Eur J Neurol</i> . 2010 Oct;17(10):1263-9. doi: 10.1111/j.1468-1331.2010.03005.x. PMID: 20402753; PMCID: PMC2924906.	To determine whether antibodies against Epstein-Barr Virus, nuclear antigen-1, early antigen, and EBV neutralizing antibodies are altered in Multiple Sclerosis.	Measured EBNA-1 IgG, EA IgG, and EA IgA using quantitative ELISA. Measured NeutAB using a quantitative competitive ELISA. Studied 80 patients with MS, 80 matched controls, and 19 patients with MS with samples collected both whilst stable and in relapse.	EBV nuclear antigen-1 IgG was increased in MS compared to controls. EBNA-1 index value was 23.3 ± 18.3 in patients with MS, and 16.3 ± 17.4 in controls.
G. Ingram	Ingram G, Bugert JJ, Loveless S, Robertson NP. Anti-EBNA-1 IgG is not a reliable marker of multiple sclerosis clinical disease activity. <i>Eur J Neurol</i> . 2010 Nov;17(11):1386-9. doi: 10.1111/j.1468-1331.2010.03083.x. PMID: 20482607.	Investigating anti-EBNA-1 IgG as an easily accessible and effective biomarker of disease activity.	Examined the applicability of findings in routine clinical practice by assessing a well-characterized cohort of 100 subjects for serum anti-EBNA-1 IgG using both the Liaison quantitative chemiluminescent assay and Biotest ELISA.	Unable to show a difference in quantitative analysis of disease subgroups, 94.70% in MS, and 93.30% in controls.
K. Wandinger	Wandinger K, Jabs W, Siekhaus A, Bubel S, Trillenber P, Wagner H, Wessel K, Kirchner H, Hennig H. Association between clinical disease activity and Epstein-Barr virus reactivation in MS. <i>Neurology</i> . 2000 Jul 25;55(2):178-84. doi: 10.1212/wnl.55.2.178. PMID: 10908887.	To assess the potential significance of Epstein-Barr virus reactivation in disease activity in MS patients.	The prevalence of antibodies against herpes simplex virus type 1, HSV-2, EBV and cytomegalovirus was determined in a group of 108 MS patients and in 163 healthy control subjects. Analyzed using combinations of novel assay systems employing highly purified viral and recombinant antigens.	Antibodies against EBV were present in 100% of MS patients. Among the tested human herpesviruses, this high extent of seropositivity was only found for EBV. Antibodies against EBV were found in 90.20% of healthy patients.

M. Munch	Munch, M., Riisom, K., Christensen, T., Moller-Larsen, A., and Haahr, S. (1998). The significance of Epstein-Barr virus seropositivity in multiple sclerosis patients? <i>Acta Neurol. Scand.</i> 97, 171–174. doi: 10.1111/j.1600-0404.1998.tb00632.x	To evaluate and investigate the significance of the previously found 100% seropositivity toward Epstein-Barr virus found in Multiple Sclerosis patients in contrast to healthy controls.	Used a commercially available ELISA-test, which differentiates infections with EBV into other infections.	137 of 138 MS patients, and 124 of 137 healthy controls were seropositive.
Elie Deeba	Deeba E, Koptides D, Gaglia E, Constantinou A, Lambrianides A, Pantzaris M, Krashias G, Christodoulou C. Evaluation of Epstein-Barr virus-specific antibodies in Cypriot multiple sclerosis patients. <i>Mol Immunol.</i> 2019 Jan;105:270-275. doi: 10.1016/j.molimm.2018.12.010. Epub 2018 Dec 15. PMID: 30562647.	Aims to evaluate the seroprevalence of EBV in Cypriot MS patients.	The serum of 133 MS patients and 101 healthy controls were used to determine the positivity index of the EBV nuclear-antigen-1 IgG.	All MS patients were seropositive for EBNA-1 IgG, as compared to 94.1% of healthy patients.

To find out the possible association between infection with HHV-6 and clinical progression of MS disease.	A total of 108 serum samples were obtained from 30 MS patients followed prospectively for a 6-month period. Analyzed for the presence of HHV-6 DNA by nested polymerase chain reaction enzyme-linked immunosorbent assay and for anti-HHV-6 IgG titer.	The average antibody index for the MS patients in the first sample collection was higher than control groups. 100% of the patients with MS had serum IgG titer while 73% of healthy patients had detected serum IgG amount.
Elisabetta Caseli	Caselli E, Boney M, Bracci A, Rotola A, Cermelli C, Castellazzi M, Di Luca D, Cassai E. Detection of antibodies directed against human herpesvirus 6 U94/REP in sera of patients affected by multiple sclerosis. J Clin Microbiol. 2002 Nov;40(11):4131-7. doi: 10.1128/JCM.40.11.4131-4137.2002. PMID: 12409386; PMCID: PMC139661.	To establish a causative role of HHV-6, due to high prevalence of latently infected individuals in the healthy population.	Developed a serological assay for the detection of antibodies specifically directed against U94/REP protein. Different populations were analyzed by enzyme-linked immunosorbent assay, including healthy controls, and MS patients.	87% of patients with MS had detectable HHV-6 IgG, while 43.9% had detectable HHV-6 serum in the groups.

Isabel Ortega-Madueño	Ortega-Madueño I, Garcia-Montojo M, Dominguez-Mozo MI, Garcia-Martinez A, Arias-Leal AM, Casanova I, Arroyo R, Alvarez-Lafuente R. Anti-human herpesvirus 6A/B IgG correlates with relapses and progression in multiple sclerosis. PLoS One. 2014 Aug	To analyze the titers of the IgG and IgM antibodies against human herpesvirus 6A/B in MS patients treated with different disease modified therapies along two-years of follow-up.	Collected 2163 serum samples from 596 MS, and 337 healthy controls. Anti-HHV-6A/B IgG and IgM were analyzed by ELISA.	98% of patients with MS had detectable HHV-6 serum, while 93.9% of healthy groups did. 69% of patients that had DMTs were free of the relapses and progression.

Table II: This is an article matrix for figure 4. It lists the corresponding author, reference, aim, methods, and results of each of the studies used.

Prevalence:

Figure 5: Prevalence of MS based on latitude (179 studies were compiled to create the graph (9, 11, 26-29)).

Figure 6 represents the seroprevalence of Epstein-Barr Virus at different latitudes. 19 studies were considered (9, 11, 18, 30).

Figures I-IV

Although the number of patients with antibodies for EBV was high in both MS and control groups, the data above exhibits a significantly higher amount of serum IgG of EBV in people with MS than in control groups. Figure 1 exhibits an increased seroprevalence of Epstein-Barr virus in individuals with Multiple Sclerosis since the error bars do not overlap. In all studies conducted that evaluated Multiple Sclerosis, the number of people with EBV antibodies was above 90%, with the amount of Serum IgG in each control group being lower than the amount in MS. A higher presence of antibodies was similarly detected for HHV-6 within patients with MS. The data above depicts a significantly higher amount of serum IgG of HHV-6 in people with MS than control groups, with this higher seroprevalence demonstrated through the non-overlapping error bars in Figure 1. There were higher numbers of people with serum IgG if those people had MS than those that did not have MS in all studies conducted.

Figure V

There appears to be a moderate association between the latitude and the prevalence of Multiple Sclerosis. At lower latitudes (closer to the equator), there was normally a lower prevalence of MS; however, when moving to higher latitudes, the prevalence appeared to increase. However, there appear to be several outliers within the 40-60 latitude range where MS demonstrates a notably higher prevalence than would be predicted by the trendline.

Figure VI

There appears to be a weak correlation between latitude and EBV seroprevalence. At lower latitudes, the data appears to have relatively lower seroprevalences than those at higher latitudes; however, there are some outliers, such as that at a latitude of 33. The increase in

seroprevalence appears minor, as nearly all data points are above 0.8 regardless of latitude. In other words, the seroprevalence was universally high, and therefore, the increase was minimal.

Discussion

This meta-analysis hopes to address the connection of Herpes viruses to the development of MS. Firstly, it examines serum IgG counts between patients with MS and the herpesviruses HHV-6, and EBV by incorporating studies from 1995-2020. Secondly, it compares the prevalence of MS to the seroprevalence of EBV from 1985-2020 to determine a potential connection that has thus far been underexplored.

There was a strong and statistically significant difference (97.64% vs. 92.69% $p < 0.05$) between the serum IgG counts of HHV-6 and EBV in patients with Multiple Sclerosis and healthy patients without Multiple Sclerosis. For EBV, while the seroprevalence in both groups was relatively high, the group of patients with Multiple Sclerosis had a significantly higher serum IgG count than patients that did not have Multiple Sclerosis ($p = 0.05$). The universality of EBV can most likely explain the high IgG count in both groups, as many children get the virus and thus are chronically infected at a young age. Yet, the higher serum IgG count in the MS group is of particular interest since the mean 97.64% suggests that EBV is nearly ubiquitous within patients having MS. EBV's ability to mimic molecules is most likely not the predominant factor here, as it would allow EBV to suppress the immune system's response and easily cause debilitating effects. This appears to be more likely when evaluating HHV-6 simultaneously with EBV, as HHV-6 seroprevalence is nearly 20% higher within patients with MS than patients without MS ($92.57\% \pm 4.93$ vs. $73.13\% \pm 12.04$). HHV-6 can also mimic other molecules, which suggests that this shared trait potentially plays a role in MS development. Within both IgG studies, the seroprevalence of EBV and HHV-6 was higher in patients with MS, overall suggesting that EBV and HHV-6 contribute to MS due to their near-universal presence within patients with MS.

Prevalence Discussion

While there appears to be a moderate connection between latitude and MS, the weak correlation between EBV and latitude suggests a similar latitude gradient barely exists for these two conditions. When investigating the connection between latitude and the prevalence of MS, there appear to be several outliers to the perceived latitude gradient. Most of these outliers fall within the European region, where there is an observed higher prevalence of MS than most other regions in the same latitude. Most notably, Northern European regions such as Norway, Denmark, and Sweden all have prevalence within the high 180-200 per 100,000 range that far exceed the predicted amount from the trendline. Similarly, Canada most notably exceeds any other region, with prevalence ranges within 400 per 100,000 people, much higher than any other area globally. Other studies that have investigated the broad scope of MS prevalence have also supported the existence of these outliers. The most prominent factor that could explain these higher results is potential vitamin D deficiency, since it is known that vitamin D levels are lower

in people that live at higher latitudes. This could result in a weakened immune response, resulting in the aforementioned molecular effects from EBV and HHV-6, or even from other conditions being exacerbated. However, since this deficiency should also apply to other areas at these same latitudes, additional factors such as people living longer, as the condition remains for the rest of a person's life, or genetic dispositions may be able to explain the abnormal prevalence(*) Longitude was investigated as a possible explanation; however, there was no evidence of a clear connection.

Seroprevalence was used as a metric to examine latitude with EBV because no observable studies explicitly showed the prevalence of EBV at different latitudes. Therefore, seroprevalence was the best alternative since it would still examine EBV within people, but simply through antibodies rather than having the virus itself. This is possibly better for analyzing EBV counts since the higher serum IgG counts in people with MS suggest that serum levels play a role in MS's development. A gradient for EBV's seroprevalence and latitude appears to exist weakly since there is a low correlation between the two (R^2 0.23). EBV's universality most likely explains the unexpected lack of an EBV gradient; since almost everyone gets the disease at a young age, it should exist within nearly all of the population. Thus, there is a high seroprevalence (nearly universal). However, the fact that seroprevalence does appear to increase slightly at higher latitudes is particularly interesting because a previous study discovered a slight connection specifically for EBV and latitude with an odds ratio of 1.06 (Distanto 2012). The supporting nature of this study suggests that a stronger connection between latitude and EBV may exist; however, the lack of data makes it impossible to establish this right now concretely. Either way, the fact that EBV appears to increase at higher latitudes alongside MS slightly suggests that EBV may play an even more pivotal role in MS's development than previously thought since it connects to MS in this regard, as well as when serum levels are being recorded.

Limitations of the IgG studies

Due to the relative lack of accessible research available that disclosed specific IgG amounts in patients with MS and healthy patients, the studies were unable to have a baseline in how the studies were conducted. While most studies appeared to have used an ELISA, or enzyme-linked immunosorbent assay, to evaluate the seroprevalence of IgG, several studies used alternative measures such as a short-termed culture assay. The differences in the types of assays utilized could have resulted in discrepancies in the acquired data. Secondly, the meta-analysis was constrained solely to evaluate serum IgG counts in patients with MS, EBV or HHV-6, excluding other types of Herpes viruses due to the lack of research available. Thus, this data is limited to only the two aforementioned Herpes viruses.

Limitations of the prevalence studies

Most notably, the lack of data surrounding EBV and latitude may have implied a weaker correlation for the latitude gradient than actually exists, as there may not have been enough data compiled for an effective measurement of EBV, mostly at lower latitudes. Since no studies

incorporated data below a latitude of 25, a possible gradient may have been omitted since data below a latitude of 25 could have strengthened the association. Additionally, data was lacking for MS prevalence within these lower latitude ranges, as a majority of the incorporated studies were at latitudes above 30.

Meta-analysis limitations

Primarily, meta-analysis poses a limitation because the researcher never does primary research when conducting their research and must rely on already existing studies. Therefore, if there is a gap in data, the researcher cannot address it effectively, since they will never be able to investigate that area of research thoroughly. In contrast, finding that gap in research may pave future endeavors when investigating the topic of interest.

Secondly, although meta-analysis poses an efficient metric for significance, it also severely limits a study's potential by evaluating results that only appear after a set of keywords. This limits what studies appear to only those on specific sites with a specific set of keywords, which could potentially disclude significant data. Consequently, this limitation serves as a sort of bias since the study is largely prone to being affected by the locations on which people decide to submit their studies.

Thirdly, meta-analysis is predicated upon reviewing other people's research; however, it limits itself since primary research is never conducted, and therefore, any research will be susceptible to the biases of the reviewed studies. This means that meta-analysis could be fundamentally susceptible to bias despite a researcher's attempts

Conclusion

Overall, there appears to be an epidemiological association between Multiple Sclerosis and the Herpesviridae viruses EBV and HHV-6, due to both the observed higher serum IgG counts of HHV-6 and EBV in people with MS, as well as the trend in latitude for both EBV and MS. Since this suggests that an even stronger correlation exists between MS and these herpesviruses, herpesviruses appear to be linked heavily to the development of MS. While this meta-analysis hopefully explains several significant etiologic facts, it also demonstrates that there are many areas of investigation that need further research. Predominantly, studies of abnormally high prevalence for MS may help to detect possible common factors that could then be connected to MS. Examining environmental determinants in these areas could result in significant, meaningful progress in understanding, treatment, and prevention of MS. Additionally, research investigating MS and EBV prevalence at lower latitudes, or MS and the prevalence of other Herpes viruses may help develop a more cohesive latitude gradient which could then be compared to one another. If a similar trend between MS and a virus is observable from one of these studies, it would be very supportive that the virus is significant in MS's development.

Competition Between the Game Industry and Merchandise Firms, Predatory Pricing in the Game Industry By Yifan Liu, Trevor Arnold

Introduction

As the game industry is playing an increasingly irreplaceable role in society, different ways for game companies to promote their products and improve their quality have appeared. Despite providing services in the game that help players have a better experience, physical goods such as comic books and badges are also offered. Game companies are the ones who focus on the quality of games and how to promote that product, while some merchandise firms will try to produce the physical goods for the game. Considering that the revenue made by merchandise firms may exceed the game company that owns this IP(known as intellectual property), how the game company balances the relationship between merchandise firms and the game company has become a heated topic. This paper mainly focuses on ways the gaming industry competes with other merchandise firms and explores evidence of whether predatory pricing affects the industry negatively or positively.

Institutional Setting/Literature Review

The video game industry has developed remarkably over the past few decades and has become a tremendous industry compared with the film industry in its annual revenue. In 1999, the U.S. Video game industry accounted for US\$7.4 billion in sales revenue, while the worldwide video game industry revenue exceeded \$32 billion (Williams 2002; Chou 2003). Since 2000, this sector has become the fastest-growing segment of the entire entertainment industry. The worldwide video game industry's rate of growth accounted for over 9% in 2013, exceeding US\$76 billion. It is expected to reach nearly US\$86 billion in 2016 (Galarneau, 2014).

Rank	Publisher	Title	Release date	game type	in-game purchases
1	Tencent	Black Myth: Wukong	2024	RPG	No
2	EA	《EA SPORTS FC™ 25》	2024	E-Sports	Yes
3	VALVE	Counter-Strike 2	2023	FPS	No
4	KRAFTON	PUBG: BATTLEGROUNDS	2017	Survival	Yes
5	Netease	Naraka: Bladepoint	2021	War	Yes
6	Visual Concepts	NBA 2K25	2024	E-Sports	Yes
7	From Software	Sekiro: Shadows Die twice	2019	Action	No
8	Recreate Games	Party Animals	2023	Leisure	Yes
9	CAPCOM	Monster Hunter: World	2018	Open-World	No

Table 1:The Top 9 Popular Games in STEAM

Physical vs. Digital markets for video games

Physical markets sell tangible products of one game. Digital markets are the opposite- consumers pay for virtual products to improve their gaming experience. Games are usually regarded as a form of service in recent days, so they are supposed to encourage players to purchase the goods provided in the game, which is about spending a little money to buy virtual

items or currency within the game. (Daniel L. Kinga, Paul H. Delfabbro, Sally M. Gainsbury, Michael Dreier, Nancy Greene, Joël Billieux, 2019)

While physical markets can offer consumers products that consumers can physically interact with, digital markets ensure consumers can make the game they play improve and progress. Physical markets attract players interested in narratives and characters. Digital markets serve those prioritizing a good game experience.

Some consumers will also switch their purchase preferences between the two markets mentioned above. For example, consumers who switch from in-game purchases to physical markets may experience a time liking the theme or the characters of the game and want to know more about those, so they turn to the physical market to purchase goods that are relevant to the elements they like in the game. On the other hand, when a simple buyer finds a product about one character that looks good and gets attracted, he or she will want to know more about that IP, so they will turn to digital markets. When the game itself becomes attractive enough to that player, the player will purchase in-game products to improve their gaming experience. As a result, the physical and digital markets are both making the game company gain fame and become increasingly popular.

The business model of a game

The phrase "business model" has been used since the 1990s and emerged with the advent of the personal computer and internet around the mid-1990s then, their concept was introduced into the mainstream vocabulary (Maggetta, 2002). It is mainly about the function a business uses to operate.

The model of the game industry can be mainly divided into two types: Pay-to-Play (P2P) and Free-to-Play (F2P); the former means paying for some items in the game to get more resources, while the latter doesn't.

As for the Free-to-Play model, Zeroukhi (2022, pp. 6 - 7) states that the business model is based on offering video games for free, but the consumers can improve their gaming experiences by purchasing extra products in certain shops. However, the products are not essential for the game but for additional enjoyment. One can still enjoy the game without any payments. As Pay-to-Play can yield most company's revenue, most of the companies use this model to run their game. It is said that 5 in 8 investors have chosen the Pay-to-Play model when inventing their games. (Peter Bellström 2024, 26) For the ones who use Free-to-Play instead, they aim to attract more players to this game, then transfer them to other games in the company, which is using the Pay-to-Play model.

Trademarks

Besides the business model, another key consideration for companies is trademarks. After content creators registered US TMs, there were fewer reprints of comic characters in books and fewer appearances in franchise movies and video games. (Franziska Kaiser, Alexander Cuntz, Christian Peukert 2023)

When the products with their trademarks enter the market, the value of the trademarks increases. To ensure the company is competitive enough, companies will be likely to make use of their trademarks, such as strategically using them in the physical goods the market produces or striking the trademarks in many parts of their products to secure market positions. As for consumers, trademarks can be partially fascinating to them, and they will be more willing to buy the product produced by the company if the product has a trademark. In this case, the products have advantages when competing with other companies as well as merchandise firms who produce similar products with the same theme. Consumers, as well as companies, can also recognize the products with the help of the trademarks. As trademarks have similar functions as IPRS(Intellectual property rights), they can prevent the firms from being imitated and having too many rival firms. By selling the trademarks and renting the trademarks, the game company can attract more investors and have better development with the help of growing resources, for the trademarks are unique. Generally, the trademarks can limit or enhance reuse.(Franziska Kaiser, Alexander Cuntz, Christian Peukert 2023)

By using strategic and exclusionary methods to limit the use of comic characters In PERSON (2016), it was mentioned that the cases are only for the US, Japan's can be quite different. The relationship between TMs and reuse varies by the type of media franchise. As digital technologies have been developed since the 2000s, this development has decreased the costs for other firms to enter the market, making the relationship between trademarking and reuse negative. (Franziska Kaiser, Alexander Cuntz, Christian Peukert 2023) For third parties, because lower costs of production, promotion, and distribution have enabled more entry, potentially including the entry of third-party users.

Innovations

Despite making money by using trademarks, making innovations in games is also considered by the game company. Some publishers may incorporate creative individuals into their groups and promote improvement in their games. Firms will also try to combine old ideas with new ones to make new products. It can also be partially related to budget constraints. The company decides how much of the proportion of funds it will spend on innovation and tries to make revenue through its new creative product. For consumers, they consider whether the product is charming enough for them to pay for these game resources.

Consumer tastes can be highly related to how companies will try to innovate. Consumer tastes are a determinant of consumer demand. The cause of the change in consumer tastes can be endorsements and personal preferences. Endorsements are about people's admiration towards celebrities, classics, or famous themes, and they can rapidly influence consumers' tastes. (Strictly Economics, 28 Jan. 2024) When a specific element that seems trustful and reliable is added to the advertisements, consumers are more willing to develop a preference for that product because of the credibility the element offers. (Strictly Economics, 28 Jan. 2024) Endorsements for game characters or the culture involved in the game will also affect consumer tastes. When one

specific animation attracts more audiences, the product produced with that trademark will have more revenue. For another aspect, consumer preferences also matter.

Preferences towards products can be shaped by the person's experiences, the customs in their regions, and their background. (Strictly Economics, 28 Jan. 2024) As personal preferences influence the choices consumers make towards various products, it can be related to consumer demand. These preferences will influence the preferences for a specific color or style. (Strictly Economics, 28 Jan. 2024) For games, it is the animations they like. In the video game industry, the preferences for different types of games or games from different companies are also regarded. When a company that owns a high popularity produces products, the consumers will be more likely to purchase the product from that company. When game companies innovate based on consumer tastes, the company will be more competitive in the market.

Table 2 : Market Share by Manufacturer in the HandheldVideo Game Industry (Calculated from Annual \$ Sales of Hardware)

Analysis

1. Competition Between Firms

Firms compete with each other by making different types of games. For example, when RPG games are famous, they will all try to produce an RPG game and compete on which game has the best fame.

In addition, in physical markets, firms set different prices for their intangible products. This process includes predatory pricing. When companies produce similar products, they will try to lower the price and force. The other firm cannot afford this pressure and exits the market. A monopoly is a way to exercise market power. The concept of competition between game companies is mainly about the popularity of various games. If a firm is popular in the market, the developers will decide to charge more for the game.

For example, the market for RPG games is competitive since the market is popular in the market. In that case, the game needs to charge less to face the competition. On the other hand, for the market of strategy games, which has a less competitive market, the game can charge more. For the market for non-free-to-play games, the marginal cost is non-zero because the developers are constantly updating and adding new stuff to the game. When the marginal cost is zero, the market power is flat. Monopoly occurs as a result. When the developers are willing to add more

extra units to the game, the players will be willing to spend more money on in-game purchases. When more units are sold, the market power goes upwards.

As a result, the marginal cost is over zero. The quantity demanded also increases, leading to more consumer purchases and revenues at the same time.

Figure 1: Not Free-to-Play Games

For market power in free-to-play games, predatory pricing can be an issue that is worth considering. Marginal costs for firms in free-to-play are greater than zero because the developers need to keep producing more in the games, for example, cosmetics, new chapters, and new characters.

Although consumers don't pay anything up front, they are willing to pay more later, so the demand curve shifts out because microtransactions add up over time. They are willing to pay more than a non-free-to-play game.

Figure 2: Free-to-Play Games

Through predatory pricing, firms with larger scales are more likely to survive, leading to a market with higher higher quality and more centralized. On the contrary, when predatory pricing happens, firms that have the potential to be popular in the game industry will be forced to leave the market. When the game firm that owns the trademark of the game leaves the market, the merchandise firms that rely on this trademark will also have to change to another trademark. Since there are no entry costs in the game market (all types of games are accepted because there will always be players), the merchandise firms also run in this way. New merchandise firms will enter the market and start another round of competition.

The predatory pricing does benefit the market, but the disadvantages should not be ignored.

2. Competition With Other Non-Video Game Firms

Video game companies compete with a firm whose primary product (licensed non-video game products) is the secondary product of the video game firm. This means that the video game firm is less productive at making the secondary product since its resources are used to make games. This is related to the economy of scale. When the scale of the merchandise firm is much smaller than the game company itself, that firm will have a low, competitive force with the game company.

The following table mainly discusses the top 10 popular games that are available in STEAM. It mainly talks about the release date, the game type, and whether there are in-game purchases. These are the main determinants of the popularity of games and whether they are competitive enough.

On the other hand, non-video game firms are doing free marketing for the video game firm. If a firm expands non-game production, whether they would keep making video games at

the same quality and price should be considered. As the company is the owner of the trademark of their games, they will be more likely to make their games. On the other hand, their fame has been improved due to their trademarks and other products, the game company who owns the trademark relies more on their products.

Conclusion

We found that the gaming industry competes with other merchandise firms by controlling their trademarks. Merchandise firms can partly help the game company to develop, and most of them can be good for the game company. Predatory pricing is affecting the industry neither negatively nor positively because the predatory pricing only happens in physical goods, they have nothing to do with the game company itself.

In future studies, how to balance the relationship between merchandise firms and the game industry should be considered to improve the quality of both virtual goods and physical goods in the games.

Public Sentiment and Policy Impact: Host Country Citizens' Attitude Towards Refugees and Migrants as a Key Criterion for Migration Policy By Gabriela Panova

Cover Sheet

I obtained the opportunity to write a research paper through the mentorship program Polygence, where students are paired with a PhD student to guide them in the process and help design evaluation methodologies.

I am the author of this paper but my mentor Danielle Williams supervised me and taught me research and citation skills over the course of our 10 sessions. As a pre-print, my paper can be found in the Research Archive of Rising Scholars website and it's currently a pending publication for the February edition of the Curieux peer-reviewed journal.

Abstract

In the context of growing socio-economic inequalities, oppressive regimes and civil wars in various countries of Africa and the Middle East, migration has once again risen to prominence in the public discourse across Europe. As a key destination for asylum seekers due to its geographical proximity with conflict epicenters, including Ukraine, it has become a focal point in debates surrounding asylum policies. Despite the extensive effort made by international organizations like the European Union and the United Nations High Commissioner for Refugees, the anti-immigrant sentiment among local populations which view this not as a humanitarian gesture, but as a threat to national identity and security, has significantly intensified in recent years. This paper argues that while various statistical criteria are typically used by researchers to evaluate the effect of migration policies, they may fail to reflect the public attitude due to misinformation and lack of transparency on refugee management. With the economic impact of immigration identified as a major concern, this analysis suggests that policymaking should focus on resolving concerns about job competition and pressure on the public services by enhancing capacity to manage the influx and by providing accessible information on the procedures following an asylum seeker's arrival at a reception center.

Introduction

Among the diverse global challenges international organizations strive to address, migration has proven to be a pressing topic with a growing demand for border control policy-making as a response to recent violent conflicts, including, but not limited to, the Syrian Civil War, the War in Afghanistan, and the Russian invasion of Ukraine. Hostilities in close proximity to the homes of civilians have pushed millions to seek refuge elsewhere, with the route to Europe appearing most promising (Di Iasio and Wahba). More specifically, Angela Merkel's decision as Germany's Chancellor in August 2015 to suspend the Dublin Regulation, an European Union (EU) law requiring asylum seekers to apply in the first EU country they enter, served as a de-facto invitation to Middle-Eastern and Sub-Saharan nationals fleeing their homeland due to instability or authoritarianism (Dernbach). With Germany envisioned by many as the end of their forced displacement journey, however, this brave but arguably hasty move led to over 1.1 million people registered upon arrival by the end of 2015 (Migration Report 2). Despite being named TIME's person of the year for her humanitarian approach to the migrant

crisis, the public opinion on Merkel dramatically shifted after the noticeable strain on public services and isolated incidents involving refugees, such as the 2015 New Year's Eve assaults in Cologne (Brenner and Ohlendorf). “Wir schaffen das,”³¹ a phrase originally symbolizing hope and determination under Merkel’s moral leadership and positioning her country as a role model in the global response to the refugee crisis, soon became a subject of mockery by critics, mainly on the political right, who used it to highlight the perceived disconnect between the government's promises and the actual challenges of absorbing so many newcomers (Karnitschnig). The backlash triggered conflicts within the EU, and as Germany’s case became emblematic of a naive or misguided optimism that ignored the complexities of the migrant crisis, this approach appeared more as a “great gamble” rather than a justified political move (Oltermann).

The debate on migration exists beyond Europe with other regions of the world also witnessing major emigration waves like those from Mexico to the US where the total encounters at the southern border exceeded 2 million in 2023 alone. Canada is another example, as it has been experiencing a housing shortage with rental vacancy rates of only 0.9% in Vancouver and Québec, and 1.5% in Toronto and Montréal, a problem blamed once again on the disproportionate influx of people (*Rental Market* 10, 81, 100, 107). Subsequently, and especially in major urban centers like these, homelessness has been on the rise, exacerbated by the lack of affordable housing options, with around 25,000-35,000 homeless people any given night, which when broken down per capita translates to about 13 homeless people per 10,000 residents nationwide (Everyone Counts).

What unites these cases is the growing anti-immigration sentiment among locals overwhelmed by the strain on government services such as healthcare, education, and housing. Some residents feel their resources are stretched thin, fueling frustration and contributing to a sense of unease or resentment towards new migrants. Additionally, accusations of compromised safety made by citizens of main refugee-hosting countries have prompted anti-immigrant protests and petitions. The role of those seeking international protection in the formation of such issues, however, is often exaggerated as in the above example with Canada where contrary to popular belief, refugees comprised only 17% of the country’s immigrant intake for 2021 (“Immigration in Canada”). For this reason, supporters of accommodating economic migrants and war refugees, convinced of the importance of this humanitarian gesture, argue that providing refuge and support is a moral obligation and emphasize the benefits of diversity. Polarized opinions like these and the politics behind solving the migrant crisis by ensuring mutual acceptance between locals and migrants is what this research aims to investigate. This paper argues that the host country citizens’ attitude towards war refugees and economic migrants is a key criterion for successful integration of newcomers and handling migration.

Typical Criteria for Measuring Migration Policy Effectiveness

³¹ “We can manage this” (translated from German)

When measuring the effectiveness of migration policy, the typical criteria used by researchers worldwide include investigating the economic impacts, the level of integration achieved and demographic indicators like population growth.

The economic way of thinking about policies refers to whether they are designed to fill labor shortages, boost economic growth or increase tax revenues. Ideally, migrants should be able to find jobs at a rate similar to the native population of the country and should receive wages corresponding to the type of labor they perform with no evidence of wage suppression. Gross Domestic Product (GDP) contribution is another main sign that government policies benefit the local economy (“How immigrants”).

Integration or acculturation as “the process of mutual adaptation between the host society and the migrants themselves” requires a different policy framework targeted at improving social cohesion and promoting diversity (*IOM AND MIGRANT* 1). Integration courses have been widely adopted to assist foreigners in adapting by providing language skills and essential knowledge about the host country's laws, values and social norms. Assessing language acquisition and civic participation among migrants is a tool authorities use to evaluate the performance of institutions managing these courses.

Demographic indicators and whether targets related to population growth and age distribution have been met serve as other criteria for handling migration successfully. Through population pyramids, the receiving country's government can track if the inflow of people is helping balance out aging populations (“Ageing Europe”). Namely, reversing the decreasing fertility rate and keeping it above the replacement rate is what host countries usually seek to accomplish when welcoming migrants (“Effect of Immigrants”).

Locals’ Attitudes as a Main Criterion

While each of the criteria described above reveals a significant part of managing migration, these pieces do not represent the full picture. Evident in numerous instances are discrepancies between statistical data and the internal dynamics of a state experiencing a period of migrant inflow. While reports may highlight that migrants contribute significantly to tax revenue, which should support public services and infrastructure, local residents may feel like these benefits are unfairly distributed or fear the possibility of job competition causing the displacement of native workers. In a different scenario, crime statistics might indicate that migrants are not disproportionately involved in criminal activities while local perceptions of safety might be negatively influenced by media coverage or misinformation.

Recent events that sparked such a controversy are the far-right riots in the United Kingdom (UK) after rumors about the culprit of the July 29th mass-stabbing in Southport falsely identified him as a Muslim immigrant named Ali al-Shakati, who “had arrived in the UK on a small boat in 2023” (Mohamed). As a response to the unfounded speculations, judge Andrew Menary lifted 17 year old Axel Rudakubana’s anonymity order, despite the British laws regarding protecting minors' identities, justifying his decision as a measure to prevent those “up to mischief to continue to spread misinformation in a vacuum” (Vinter). The identity disclosure

of Rudakubana, born in Cardiff, Wales, to Rwandan parents, proved the importance predisposed beliefs have on public perception and reaction. Despite clear evidence refuting the rumors, the pre-existing biases and fears about migrants fueled continued unrest and violence.

This case highlights how deeply entrenched stereotypes can drive social tensions and influence behaviors. Counterintuitive to the impression such isolated violent acts can give, statistics present a different reality. With a year-on-year difference of -8.11%, crime rates in the UK (excl. Scotland) have significantly decreased over the 12 month period from June 2023 to June 2024, compared to the same time period ending in June 2023 ("Explore Crime"). And yet, how the public feels about an issue has proven to be most indicative of the government's success or failure in addressing it, which suggests that to build an inclusive society, the attitude of host country citizens is crucial, and factors influencing it must be investigated further. This process must, of course, be backed up by statistics on the predicted contribution migrants will have on a state's economy.

Factors Influencing Host Country's Citizens Attitudes Towards Migration

Polarized opinions on the numbers and types of migrants a country should accept have continuously divided societies, particularly those located in regions that are prime destinations for people fleeing poverty, inequality, persecution and conflict. These countries, often seen as attractive due to their economic opportunities, political stability or social services, are the most susceptible to intense debates and divisions over migration policies. Among the underlying drivers of societal divisions are some socio-demographic factors which will be discussed in the following sections.

Socio-demographic Factors

Generational difference

Generational differences significantly impact views on migration, as younger and older generations often have contrasting perspectives influenced by historical contexts and relative exposure to diversity ("6.2 Political"). The concept of "political socialization," which refers to how individuals develop their beliefs, values and attitudes, is central to understanding these differences and is a process commonly shaped during one's mid-teens and mid-twenties by factors such as family upbringing, education, media exposure and significant socio-political events (Niemi & Hepburn, 1995). Nevertheless, a political generation doesn't necessarily stick with the same set of opinions throughout the life course, but instead reorients if expectations aren't met or new factors come in place.

A 2023 study examining how generational cohorts' attitudes toward immigration are shaped by the political climate during their formative years identifies the temporal-spatial political context as crucial to forming these attitudes. Specifically, it defends the hypothesis that cohorts socialized during periods emphasizing equality are more likely to support immigration, as opposed to those socialized during times prioritizing tradition (Jeannet and Dražanová).

Having lived in an increasingly integrated environment where multiculturalism and diversity have become the norm, younger people nowadays are largely exposed to the former. Their political socialization process is typically influenced by liberal education systems, media, travel, and global humanitarian movements, which prompts them to embrace migration policies highlighting human rights, inclusivity and the benefits of a diverse workforce. When US citizens were asked about what businesses facing labor shortages should do, raise wages to recruit Americans or recruit immigrant workers to keep costs down, 60% of those aged 65 or older chose the former, while only 36% aged 18 to 29 preferred this to recruiting foreigners (Orth). While this supports the research results, such data doesn't comment on which side is "correct" or on whether liberal views are what societies should strive for. Excessive inclusiveness can blur the lines between preventing inequality based on stereotypes and adhering to the law, evident in the fact that about half US citizens between the ages of 18 and 29 believe that illegal immigrants should be "allowed to stay in the U.S. and eventually apply for citizenship," compared to only 31% of people aged over 65 (Orth).

While a common temporal-spatial environment often influences individuals' political beliefs in a similar direction, this is no guarantee that opinions will remain consistent. Certain people's views might deviate from what's most prominent due to outside factors like belonging to an underrepresented group, or even cohorts as a whole can slightly alter or shift their stance throughout their lifetime. Thus, while the political climate during one's formative years is likely to bring about similar attitudes about immigration, generalizing this for distinct communities within the state risks ignoring the impact individual experiences have on shaping these attitudes.

Religion

Another trend associated with generational difference is a decreasing religious affiliation among young people worldwide. While studies have shown that this is a factor contributing to the LGBTQ+ rights movement due to fewer people being concerned with the same-sex marriage ban for religious reasons, as well as abortion rights, the influence religion has on one's stance in the immigration debate doesn't appear that convincing (2. Young). Among surveyors asked whether religion has a major impact on their opinion of how immigration should be dealt with by the government, only 7% agreed it does. By contrast, 35% of respondents admitted that opposing gay and lesbian couples has been rooted in their religious beliefs.

Despite the presumed insignificant role of religion, more specifically of Christianity among US citizens as according to the poll above, translating this to inherently Christian nations around Europe reveals a different picture. Plotting data of the total % of EU citizens sharing agnostic (non-believer) and atheist views by country against the total % of immigrant integration supporters, a scatter plot diagram visualizes a low positive correlation between the two variables. Among societies less dependent on religion, generous views on migrant acculturation prove to be more prominent, with the exception of the Czech Republic where 65% have stated that immigrants are a burden to the welfare system, and above 70% - that they increase the crime rate (Dodevska).

Fig 1: Support for migration vs non-believers by EU country (%)

This model, however, cannot be discussed thoroughly without taking into account the limitations of establishing a causal relationship between religion and attitude toward immigration. No religion is inherently anti-migrant in its teachings, and religious books tend to be a subject of interpretation by local preachers or representatives of religious groups on a national and international level (Christerson et al.). Religion can be utilized as a political argument to either support or oppose immigration, evident through the way different leaders justify their decision on whether to comply with refugee quotas. Viktor Orbán, the Hungarian Prime Minister, emphasizes Hungary's identity as a Christian nation to point out the incompatibility between majority non-Christian asylum seekers from the Middle East and citizens of his country, thus rejecting the refugee quotas assigned by the EU. On the other hand, Pope Francis who advocates for acceptance and warm welcoming of those in need of shelter, and numerous refugee charities run by churches argue that Christianity's core principles dictate their efforts in aiding people regardless of their background (Storm).

For this reason, defining this relationship as correlational instead of causal helps us focus on other variables to explain the positive slope of the graph above. Associated with high numbers of non-believers is also the high democracy index in European countries like Sweden, Denmark, and the Netherlands, all of which were estimated as a 10 by the Polity5 Project of 2020: with this being the maximal score on the range, it indicates competitive, multi-party elections and recognizes these countries as fully democratic ("Democracy Index"). While democracy itself doesn't dictate attitudes on immigration, it can indirectly influence local people's perception of the possible benefits of newcomers through the instrumental variable of how confident citizens are in their government's policies in general, and more specifically, in regard to migrants. This

applies especially to attitudes on those granted asylum as trusting authorities in maintaining the influx proportional to that country's job and accommodation capacity is crucial to building a welcoming and supportive society.

If, however, there is an aspect of religion that could potentially prevent peaceful cooperation and thus partially explain the positive slope above, this would be religious fanaticism and the extent to which members of a society identify with extremist views of their religion's dominance over others. In Europe's case, where an estimated 76% of the continent's population is Christian, this phenomenon would most likely express itself as a juxtaposition between Christianity and minority religions (*Europe*). A study conducted among 15 western European countries revealed that Christians, regardless of being church-attending or non-practicing, were more likely than people without a religious affiliation to hold anti-immigrant views and express hostility to Jews, Muslims, and migrants ("Study: Christians"). An example is France, where 72 percent of churchgoers and 52 percent of non-practicing Christians agreed that French ancestry should be kept "truly French," as opposed to only 43 percent of atheists and agnostics questioned. Undeniably though, the transition between having religious beliefs and expressing religious zealotry is far less prominent and on a much smaller scale than other extremist movements in history, such as the 19th and 20th century German nationalism.

Although some people may consider their religion when forming an opinion on how their country should handle forced displacement, religion is by no means a definitive factor for the formation of a shared anti-immigrant sentiment. Individual religious fanaticism, even though present, lacks the ability to determine how a nation where such extremes are rare can incline toward rejecting Christianity's core values.

Preferences for Migrant Category

With the possibility of religion playing a significant part in preventing inclusivity or discouraging empathy for the average host country citizen ruled out, this next section will focus on discussing how opinions on immigration may vary based on the category of migrants host country citizens are questioned about.

A major distinction is that between migrants working as high-skilled and low-skilled laborers. With economic concerns as a main driver of anti-immigrant sentiment, investigating what causes nuanced attitudes has been the objective of numerous studies (Nowrasteh). Accusations that immigration abuses the welfare state and increases government debt and budget deficits have prompted researchers to seek evidence of whether natives in migrant receiving countries are more or less accepting of foreigners in relation to the role they'll have in the job market. As an underlying concept, the *net fiscal burden hypothesis* claims that the government incurs a higher marginal cost from a migrant's entry, including expenses for social services and public infrastructure, than the marginal revenue it gains through direct taxes on the migrant's economic activities and additional taxes generated by that person's presence ("Fiscal Burden"). From the perspective of locals, however, this is not a fixed scenario as surveys on the preferences

for the level of skill immigrants possess reveal. Compared to low-income respondents, among whom the difference wasn't that significant, wealthier citizens across the 15 European countries examined reportedly expressed a stronger preference for migrants working as high-skilled over those working as low-skilled laborers (Naumann et al.). There are two explanations for the results: low-income natives have a general tendency to oppose immigration more out of job security-related fear, and high-skilled migrants are more well accepted universally due to the perceived economic benefits they can offer, regardless of the economic background of the native respondent.

The Eurobarometer *Integration of Immigrants in the European Union* report that covers survey results featuring all member states confirms the correlation between income level and migration acceptance mentioned above. When asked whether actively promoting migrant integration is a necessary investment in the long run, the percentage of respondents agreeing saw a steady increase in respect to the class they consider themselves belonging to. Starting out from the working class and peaking at those surveying as part of the upper middle class, the percentage of supporters was 60, 65, 72 and 81 respectively (*Integration of Immigrants* 73). Mirrored in another classification of EU member state citizens, this time based on their reported difficulty paying bills, the results persist as the difference between those who admit to experiencing difficulties and those who “never” or “almost never” do is 19%.

With evidence that income level is among the most decisive factors influencing attitudes, understanding how opposition differs based on the migrant's background and their set of skills is necessary to create an even more complete picture of the immigrant-host country citizen dynamics. Though limited to Great Britain, the Migration Observatory at the University of Oxford has found that greater importance is attached to migrants' skills rather than their country of origin ("UK Public"). Twenty and 21% of participants agreed that when it comes to professionals from India and Poland respectively, many should be allowed to immigrate and the numbers of those voting “Allow some,” “Allow few” and “Allow none” also remained largely identical. Unskilled laborers, on the other hand, were regarded much less favorably as consistent with previous research. Most importantly, country of origin seemed not to be a factor that natives take into account when asked, for example, about Indian and Polish unskilled individuals. In this instance, results remained similar, as only 8% and 9% were in support of granting entry on a large scale.

Changes to Ethnic, Religious and Cultural Homogeneity

No debate on immigration is complete without raising the question of the demographic and cultural change that inclusivity in this, and other contexts, brings about in society. Some factors significantly influence the opinion locals in migrant receiving countries hold about welcoming immigrants, including perceived impacts on local job markets, social services, and public resources. The economic impact has emerged as a top concern, while religion and migrant characteristics unrelated to the benefits or dangers they might pose have taken a back seat. Coexistence and integration, however, are peacefully accepted only under the condition that it

doesn't compromise personal comfort, safety, and quality of life. For this reason, policies should be designed to address these concerns, with special focus on preventing potential areas of tension, which could negatively impact the community and exacerbate any existing hatred, prejudice, and societal imbalances.

Policy Implications

Despite the abundance of research on attitudes toward immigrants as a whole, few scholars have isolated the cases of specific migrant groups and differentiated between how each is regarded (Abdelaaty and Steele). Survey results tend to draw misleading conclusions about natives' attitudes due to question formulations which combine immigrant categories under the common term of "migrants." In fact, while international migration encompasses all foreigners who have moved to the country regardless of their motivation, the context in which most surveys conducted in Europe aim to collect data is the ongoing migrant crisis ("What Is the Difference"). For this reason results, which at first glance refer to how well immigrants are or aren't integrated, how high support levels are as voted by local communities, etc., often reflect the public perception not of foreigners in general, instead of asylum seekers and those granted the refugee status ("Migrants, Asylum").

This distinction suggests that when evaluating policies, we should target those concerning asylum applicants and the procedures following their reception. More specifically, their access to the labor market and the awareness host country citizens have of enforced legal frameworks regarding immigration and refugee rights is essential for fostering social cohesion.

Fulfilling Economic and Labor Shortage-Related Goals

While granting international protection to refugees is undoubtedly consistent with the moral values upheld by organizations like the EU, taking into consideration the capacity of host communities should remain a priority to ensure that the integration process is sustainable and does not overwhelm existing resources ("Aims and Values"). As a measure of how welcoming a state is, policies restricting immediate access to the labor market have been utilized by various recipients as a deterrent to potential asylum seekers. The Refugee Convention declares that EU member states are not obliged to give a work permit to anyone not legally resident and can thus place conditions 'for reasons of labour market policy' ("Policy Paper"). One such condition is a waiting period before being allowed to enter the workforce, and it varies greatly among European countries, ranging from one month in Portugal to twelve months in the UK. Exceptions, however, can be found on both ends: in Greece and Austria, in addition to non-EU states Sweden and Norway, some individuals can work right upon submitting their asylum claims, as opposed to Lithuania and the Republic of Ireland which are the only EEA members not granting the right at all ("Asylum Seekers").

This freedom on refugee work-related policy making is largely justified by the context-dependent benefits or drawbacks of each approach. Among the benefits of delaying access to the workforce is guaranteeing thorough assimilation through language acquisition

courses, while a major challenge is the dependence on economic state assistance during the waiting period. Immediate employment, on the other hand, allows refugees to become self-sufficient more quickly, while posing the risk of causing job market pressure and exacerbating job competition in case of high unemployment (Ginn 6-9). When it comes to completely denying access to the workforce, it can grant a sense of control over the actions of asylum seekers once on host country's territory but can equally be a gateway for illegal exploitation of those desperate to find alternative means of income beyond the limited government assistance they receive. While it's unclear how many people engage in such informal, unregulated channels, out of the over 5,500 inspections carried out by the National Employment Rights Authority (NERA) in Ireland in 2014, 43% uncovered cases of labor exploitation much of which was in sectors dominated by foreign laborers (*All Work 2*). Unpaid overtime, wages below the legal minimum and mistreatment are among the issues of employment ban for asylum seekers in Lithuania and previously, the Republic of Ireland, which has, after reports by the Irish Refugee Council, reformed its policies to allow participation in the labor market six months after applying for international protection ("Access to the Labour"). It's likely that more restrictive policies on the right to work increase the chance of threats forcing workers to comply with exploitative conditions. This suggests that the best pathways for managing the issue are either shortening the waiting times or ensuring thorough oversight by regulatory bodies to proactively inspect high-risk sectors in order to mitigate exploitation risks and uphold labor standards.

To develop policies tailored to a specific state in case that state chooses to grant labor access as recommended by this paper, a comprehensive assessment must be conducted to identify which approach will be most suitable for that state's needs in respect to the labor market and the qualifications immigrants possess. After comparing these aspects and following the example of the UK, a *Shortage Occupation List*, now replaced by the *Immigration Salary List* can be created and referenced while reviewing work permit applications (Morris). They serve similar purposes, though with updated criteria the ISL, introduced in April 2024, focuses on managing skilled worker immigration by setting specific salary thresholds for occupations that are in demand. A key feature of the ISL is the removal of the 20% "going rate" salary discount, which used to allow employers to recruit foreign workers at salaries 20% below the standard rate for listed occupations. The ISL still includes a 20% discount, this time, however, on the general salary threshold. This applies only in case it doesn't reduce the salary below the minimal threshold set for that particular occupation (Morris). Similar policies can benefit both the local workforce and immigrant/refugee communities by ensuring fair compensation, which attracts skilled workers and thus fills critical labor gaps, supporting economic growth, while also preventing wage suppression.

Another initiative with a similar concept of facilitating the matching of employers with non-EU nationals is the EU Talent Pool, currently launched by the European Commission as a web-based Pilot portal designed to showcase applicants' qualifications and professional experience (Communication from). Despite not targeting asylum seekers exclusively, priority

sectors affected by immigration, such as healthcare and education, can be better supported by ensuring that they keep up with the demands of a growing population. Aligning the EU Talent Pool and derivative programs with these fields can help enhance service delivery both by employing skilled foreigners and by increasing host country's infrastructure capacity ("EU to Facilitate").

Nevertheless, major limitations prevent the effective adoption of similar frameworks as the UNHCR and OECD-led dialogues with employers have revealed ("OECD Engaging"). Among the shared obstacles in hiring asylum seekers that most stakeholders addressed is matching refugee and asylum seekers' formal qualifications to the host country requirements and recognizing degrees and certifications acquired abroad. This, combined with concerns about an applicant's length of stay or uncertainty regarding the rights and conditions of employment, has caused employers to overestimate the inconvenience of recruiting foreign candidates. Lack of language proficiency is another barrier for entering a wide range of occupations, especially in the service sector. While integration courses can help address this, skill identification and profiling remains a challenge. Still, international efforts like the "Skills Profile Tool for Third Country Nationals" developed by the European Commission, alongside country-specific ones like Norway's *Introduction Programme* and Finland's *Skills Assessment Centers*, offer promising approaches to addressing these challenges and enhancing workforce (Huddleston).

With corporate social responsibility (CSR) as a widespread motivation especially among larger companies, assimilating third country nationals into the workforce is increasingly feasible. For this to be effective, it is essential to provide comprehensive language and integration courses, establish robust platforms for skill assessment, and facilitate meaningful interactions between job seekers and employers.

Transparency

Ensuring that refugees and asylum seekers are net fiscal contributors overall should be the first step of policy-making in major immigrant-receiving countries. Though one strategy would be attracting skilled individuals through tailoring their qualifications to the local market's needs, similar policies can be applied to migrants working as low-skilled laborers. Job matching and accommodation in close proximity to employment opportunities can help maximize their economic potential in sectors such as agriculture, construction, and caregiving, which natives often avoid due to having a comparative advantage in occupations requiring communication in the local language (Jaumotte et al.) Additionally, offering targeted vocational training and social integration support will enhance their long-term employability and social participation.

Assimilation into the host country's environment and culture, however, is a process equally dependent on the support expressed by local citizens. Regardless of how successful the policies regulating the influx of asylum seekers and the procedures following their reception are, persisting prejudices might stand in the way of natives recognizing the economic benefits migrants bring. This indicates lack of transparency in communicating how immigration is sustainably regulated, instead inciting deep resentment even in response to isolated incidents.

The Special Eurobarometer 519 report, which ranks EU member states by the answers respondents gave to a set of questions on the topic of immigrant integration in their country, reveals a notable similarity between the rankings for two questions in particular. Countries where a high percentage of respondents agreed that promoting immigrant integration is a “necessary investment in the long run” closely align with those where citizens reported feeling “well informed” about immigration and integration matters. Notably, over four-fifths of member states maintain their positions within the same half of the ranking and the same five countries top both podiums (Jaumotte et al.). This correlation suggests that government transparency is a decisive factor in shaping the public perception of the long-term economic and social necessity of such initiatives.

Governments can engage in effective communication through providing accessible information about immigration policies, how they reflect changing societal dynamics and evolve as studies and statistics point to new labor market needs and demographic trends. Official websites and public campaigns can be used as mechanisms to foster a more informed and cooperative public. Failure to counteract misinformation would be detrimental even to a system of well-designed procedures that include maintaining the influx proportional to a country’s capacity and executing successful integration strategies. Allowing misconceptions to flourish could spark resistance, undermining the implemented policies. Disinformation campaigns, too, fall into this category and though most are initiated by xenophobic or extremist individuals, social media algorithms, as well as the lack of critical media literacy among the public significantly amplify their scope (Szakács and Bognár 45). These can shift public opinion in either direction, for example by directly addressing foreign nationals through false accusations of criminal offenses, but can also manipulate news outlets and online forums to make some views seem more prevalent. Inflated protest sizes are one instance of how disinformation can indirectly shape opinion by creating a false impression of widespread opposition, ultimately distorting public perception (Sparrow). Preventing such disguised strategies of influence is what governments should focus on to ensure well-justified votes and conflict-free integration.

It’s worth noting that less informed citizens don’t necessarily indicate lack of government transparency but can instead mirror a society with limited exposure to foreigners and protection seekers as a consequence of specific historical or geopolitical contexts. In such cases, immigrant integration may not emerge as one of the primary issues on the mainstream political agenda, leading to its deprioritization both by policymakers and the electorate. Consequently, it might not become a critical factor for voters, reducing the likelihood of single-issue voting on these matters and allowing them to remain peripheral in political campaigns and governance despite their long-term societal importance. Open communication channels, however, must still be available, in addition to public forums and press briefings hosted by governments to ensure accountability even when addressing topics that may not dominate the immediate political discourse.

Conclusion

While no universal framework can target the needs of every refugee-receiving country with equal effectiveness, various surveys and studies have highlighted that boosting economic growth and reversing adverse demographic trends are common aspects of successful immigrant integration. Although statistics can, on paper, predict the potential outcomes of accommodating a set number of refugees, the local population's attitude toward newcomers is crucial in shaping societal dynamics.

This mutual process requires policies which, on one hand, regulate the reception of asylum seekers and the numbers of those granted with the refugee status to ensure that public resources and services are not strained beyond capacity. On the other hand, justified refugee quotas must be shared with the public through open communication channels in order to guarantee transparency and prevent resistance due to misinformation or manipulative political rhetoric. Refugees and asylum seekers' net fiscal contribution is dependent on both host society's support on a daily basis and the employee-employer relationships they establish. Uncertainties regarding the conditions of engaging in the workforce is another issue governments are advised to resolve by streamlining employment pathways, offering language and vocational training, and ensuring that legal barriers to the labor market are not exacerbated by exploitation of foreign nationals.

Unfolding Layers of Identity in *The Paper Menagerie* By Sriteja Kataru

The universal voyage of immigrants across the globe unfolds countless tales of hope, resilience, and the search for identity within unfamiliar territories. This journey displays immigrants embracing new environments while also preserving ancestral roots. While achieving such a balance remains possible, some instances showcase its elusiveness. In Ken Liu's *The Paper Menagerie*, the meticulous interweaving of symbols, especially the origami animals, displays the struggle between cultural heritage and assimilation and profound emotional and physical losses stemming from distancing oneself from one's roots. At first, the paper animals serve as a form of consolation and a representation of heritage, but as the story unfolds, they turn into objects of Jack's disdain and rejection. However, as he matures, Jack returns to the origami, finally embracing his identity but also mourning his mother's loss and regretting his past animosity towards his true culture.

Initially, Liu portrays these living paper animals in a positive light, constructing the symbols as a way to stop Jack from crying – and it works. Jack describes his mom “breath[ing] into her paper animals so that they shared her breath, and this moved with her life” (Liu 27), highlighting the connection between the mother and the origami creations. One can interpret this action of breathing life into them as imbuing them with the mother's emotions and cultural essence, transforming them into living entities that echo her identity and heritage. “‘*Laohu*.’ *Look, a tiger*” (Liu 26), the mother says to Jack when consoling him. At this moment, Liu encapsulates a moment of wonder and discovery, as he cements the tiger as a symbol directly tying the creature to the mother's Chinese heritage, serving as a subtle yet potent reminder of the familial and cultural bonds that are embedded into Jack's identity. However, the once cherished symbols of his cultural heritage become shadows cast in the glaring light of self-rejection as Jack begins to realize his uniqueness in society.

As the story progresses, Liu transforms ‘*Laohu*’ from a beloved symbol of heritage to a conflicted one, mirroring Jack's struggle with his cultural identity and escalating the central tension between tradition and assimilation. For instance, when Mark criticizes the origami, Jack thinks, “I had never thought of *Laohu* as trash. But looking at him now, he was really just a piece of wrapping paper” (Liu 31). Liu illustrates a significant shift in Jack's perception of the paper tiger by reflecting his growing detachment and devaluation of his cultural heritage. Evidently, Liu now invokes a negative light surrounding the paper origami, which parallels Jack's desire to fit in and avoid being seen as a social outcast. During this period of late childhood, Jack shuns the origami (and his heritage as a result), which Liu emphasizes by Jack shoving all the origami animals into a shoebox and confining them to the corner of the attic. Jack eschewing the origami also correlates to him refusing to talk to his mother when she speaks in Chinese and rebuking her for “not belonging” (Liu 32) in society. Thus, Jack's distancing from his culture paves the way for a reflective journey in adulthood, where he encounters mixed feelings of remorse and rediscovery related to his neglected heritage.

In his adult years, Jack confronts the origami after his mother passes away, leading him to reevaluate his cultural identity and grapple with feelings of regret and a longing for reconnection to his roots. When he gets someone to read the letter to him, he expresses, "I felt the words sinking into me, through my skin, through my bones, until they squeezed tight around my heart" (Liu 38). He feels the pain of not being able to comprehend his mother's words, and how the culture that he shunned in his childhood has come back to him, this time with devastating consequences. In this situation, Liu evokes both a positive and negative connotation in relation to the origami. On the negative side, he highlights Jack's regret and remorse of rejecting his heritage and communicates to the reader to take Jack as a model of what not to do and embrace who you really are without being concerned with the rest of society. However, he displays Jack's newfound appreciation and understanding of his mother's love & culture. He reconnects with his roots and gains insight into the depth of his mother's feelings, experiences, and her struggles as an immigrant. In essence, Liu illustrates the reconciliation with one's roots and the profound realization of loss and understanding, prompting reflections on embracing heritage while seeking acceptance.

In conclusion, Ken Liu's 'The Paper Menagerie' skillfully illustrates the intricate journey of cultural identity and assimilation through the evolving symbolism of origami animals. These creations begin as comforting representations of heritage and familial love, transforming into reflections of rejection and self-denial as Jack contends with his multicultural identity. Ultimately, in adulthood, they become profound symbols of remorse and enlightenment. Liu's story thus stands as a reminder of the importance of accepting one's cultural roots, the sorrow stemming from denial, and the potential reconciliation and insight gained through acknowledgment and comprehension.

The Impact of Hypertension on Attention Span and Cognitive Abilities By Oli Kitil

Introduction

Hypertension, or high blood pressure, is perhaps the most common medical condition worldwide with hundreds of millions more people believed to be affected globally. Hypertension is associated with effects on cardiovascular health, and it exerts neurobehavioral sequelae, especially in cognitive function and attention. This paper will examine attentional abilities and hypertension.

Background on Hypertension

Hypertension, contrary to its name, is long-term and means high blood pressure. One of the major risk factors for cardiovascular diseases is high blood pressure, which can lead to stroke, heart attack, or any artery that supplies your peripheral organs with energy needed by muscles being inhibited leading to congestive cardiac failure (Elias, M. F., et al., 2012). The disease often fails to produce symptoms, which is why it can be very dangerous to spot when it is there. Complications of chronic hypertension include damage to blood vessels, kidneys, and the brain (Iadecola, C., & Davisson, R. L., 2008).

The Physiological Mechanisms of Hypertension

Vazzello. (2017). Endothelium: Inner layer of the blood vessel [Image]. Vazzello. Retrieved August 2, 2024, from <https://vazzello.com/endothelium-inner-layer-of-the-blood-vessel/>

Hypertension affects the body through numerous physiological effects. This damages the endothelium (the inner lining of blood vessels) (Iadecola, C., & Davisson, R. L., 2008). Hypertension also causes left ventricular hypertrophy (thickening of the heart muscle), which can inhibit cardiac efficiency. In addition, hypertension also inhibits cerebral autoregulation which is the brain's ability to self-regulate blood flow in response to changes of systemic blood

pressure (Gąsecki, D., Kwarciany, M., Nyka, W., & Narkiewicz, K., 2013).

Gąsecki, D., Kwarciany, M., Nyka, W., & Narkiewicz, K. (2013). Hypertension, Brain Damage and Cognitive Decline. *Current Hypertension Reports*, 15(6), 547-558. [PMID](#)
Relationship Between Hypertension and Cognitive Function There is a growing body of evidence suggesting that hypertension negatively impacts cognitive function. The brain is highly sensitive to changes in blood flow, and hypertension can cause microvascular damage, leading to reduced cerebral perfusion. This reduction in blood flow can impair the brain's ability to function optimally, resulting in cognitive deficits.

1. Cerebral Blood Flow Reduction

Hypertension leads to the stiffening and narrowing of blood vessels, which impairs cerebral autoregulation (Gąsecki, D., Kwarciany, M., Nyka, W., & Narkiewicz, K., 2013). This means the brain has a reduced ability to maintain constant blood flow, particularly during fluctuations in blood pressure. Consistent high blood pressure causes chronic reductions in cerebral blood flow, depriving the brain of adequate oxygen and nutrients, which are essential for maintaining cognitive functions (Iadecola, C., & Davisson, R. L., 2008).

2. White Matter Lesions:

Courtesy of SPRINT MIND Investigators. 'Scanning for White Matter Lesions.' EurekaAlert!, [NIH/National Institute of Neurological Disorders and Stroke](#). Accessed August 2, 2024

Hypertension is associated with the development of white matter lesions in the brain. White matter is crucial for efficient communication between different brain regions (Gąsecki, D., Kwarcianny, M., Nyka, W., & Narkiewicz, K., 2013). Lesions or damage in this area can disrupt these communication pathways, leading to declines in cognitive abilities. Studies have shown that individuals with hypertension have a higher prevalence of white matter lesions, which are linked to cognitive impairments, including slower information processing and diminished executive function (Elias, M. F., et al., 2012).

3. Endothelial Dysfunction

Bernard, I., Limonta, D., Mahal, L. K., & Hobman, T. C. (2020). Comparison of healthy vs dysfunctional vascular endothelium [Image]. Wikimedia Commons. Retrieved August 2, 2024, from <https://www.mdpi.com/1999-4915/13/1/29>

The endothelium plays a key role in vascular health, including the regulation of blood flow and the maintenance of the blood-brain barrier. Hypertension induces endothelial dysfunction, characterized by reduced nitric oxide availability and increased oxidative stress (Iadecola, C., & Davisson, R. L., 2008). This dysfunction can contribute to vascular inflammation and increased permeability of the blood-brain barrier, potentially leading to neuroinflammation and cognitive decline (Gąsecki, D., Kwarcianny, M., Nyka, W., & Narkiewicz, K., 2013).

4. Neuroinflammation

Chronic hypertension can trigger neuroinflammatory processes. The persistent high blood pressure promotes the release of pro-inflammatory cytokines and other inflammatory mediators (Iadecola, C., & Davisson, R. L., 2008). Neuroinflammation is implicated in the

pathogenesis of various neurodegenerative diseases and can exacerbate cognitive decline by damaging neurons and synapses, further impairing cognitive functions (Gąsecki, D., Kwarciany, M., Nyka, W., & Narkiewicz, K., 2013).

Effects of Hypertension on Attention Span

Attention span is one of the cognitive functions most affected by hypertension. Studies have shown that individuals with hypertension often have difficulty maintaining attention and may experience slower cognitive processing speeds. These deficits can impact daily functioning, reducing productivity and quality of life.

1. Sustained Attention

Sustained attention, the ability to maintain focus on a task over a prolonged period, is crucial for many daily activities. Hypertensive individuals often exhibit impaired sustained attention, which can affect their ability to complete tasks that require long periods of concentration. This impairment is likely due to the reduced cerebral blood flow and white matter lesions discussed earlier, which disrupt the neural networks involved in maintaining attention.

2. Selective Attention

Selective attention refers to the ability to focus on relevant stimuli while ignoring distractions. Hypertension can impair this ability, making it more challenging for individuals to concentrate in environments with multiple stimuli. Studies have shown that hypertensive individuals may take longer to filter out irrelevant information and focus on the task at hand.

3. Divided Attention

Divided attention, or multitasking, involves processing multiple sources of information simultaneously. Hypertensive individuals often struggle with tasks that require divided attention, as their cognitive resources are already strained by the effects of reduced cerebral blood flow and neuroinflammation. This can result in slower reaction times and increased errors when performing tasks that require simultaneous attention to multiple stimuli.

4. Executive Function and Working Memory

Executive functions, including working memory, are closely linked to attention span. Working memory allows individuals to hold and manipulate information temporarily. Hypertension can impair working memory, leading to difficulties in tasks that require holding and processing information over short periods. This impairment further contributes to the challenges hypertensive individuals face in maintaining attention and performing complex cognitive tasks.

Potential Interventions and Management Strategies

Effective management of hypertension is crucial to lessen its cognitive effects. Lifestyle modifications, such as regular physical activity, a balanced diet, and stress management, can help control blood pressure. Pharmacological treatments, including antihypertensive medications, are also effective in managing hypertension and reducing the risk of cognitive decline. Regular monitoring and early intervention are key to preventing the long-term cognitive consequences of hypertension.

Conclusion

Hypertension has a significant impact on cognitive function, particularly on attention span. The evidence suggests that hypertension-induced cerebrovascular damage and reduced cerebral blood flow contribute to cognitive impairments. Effective management of hypertension is essential to preserve cognitive health and improve overall quality of life. Further research is needed to fully understand the mechanisms underlying this relationship and to develop targeted interventions to mitigate the cognitive effects of hypertension.
